

# Servomotors

## Order Catalogue

### Series:

- LSH servomotors,  
nominal torque: 0.2 to 21 Nm
- LST servomotors,  
nominal torque: 0.1 to 60 Nm
- LSx servomotors  
with 24 V and 48 V windings,  
nominal torque: 0.1 to 0.8 Nm

## Procedure for selecting a motor

<b>Basic considerations</b>		In order to select the correct drive and motor, the specific speed and the load cycle for the drive task must be known.
<b>1.</b>		Determine the Index of Protection: IP64, IP65
<b>2.</b>		Determine the supply voltage: 230 V to 400 V
<b>3.</b>		Determine the space available
<b>4.</b>		Determine the maximum torque from the load cycle profile; see the c-line drives project planning manual, in the appendix page 18 on our product CD.
<b>5.</b>		Determine the average (effective) torque; see the c-line drives project planning manual, in the appendix page 18 on our product CD.
<b>6.</b>		Determine the type of motor required: LSH/LST, see page 1-2
<b>7.</b>		On the respective data page, select the motor which satisfies the following criteria: Synchronous servomotor: $n_{\max} \leq 1.1 \cdot n_{\text{nenn}}$ $M_{\text{eff}} \leq M_{\text{nenn}}$
<b>8.</b>		Determine the necessary encoder system: Resolver, incremental encoder sin/cos 1 V <sub>pp</sub> , absolute value encoder; see chapter 6, Encoders
<b>9.</b>		Complete motor designation with all necessary options (type code); see page 1-4
<b>10.</b>		Determine the length and cross-section of the ready made-up power cable required, or determine the plug size for customer installation; see the c-line drives project planning manual, in the appendix page 18 on our product CD.
<b>11.</b>		Determine the ready made-up encoder cable required, or determine the plug size for customer installation, HTL incremental encoder, resolver, sin/cos 1 V <sub>pp</sub> incremental encoder, absolute value encoder; see chapter 6
<b>12.</b>		Refer to the selection and ordering data to select the inverter / servocontroller for the selected motor, based on the standard overload conditions. The inverter / servocontroller should be selected for the respective motor standstill current and motor rated current.

# The correct choice of motor: LSH or LST?

**Irrespective of which variant you select: in either case you have chosen a high quality synchronous servomotor.**

This is because the LSH, like the LST motor also, is fitted exclusively with high-quality bearings, an identical flange, the same insulation system and the same encoder system. In short: the mechanical aspects are absolutely identical and offer exactly the same very high quality level!

The LST motor differs from the LSH motor in the arrangement of the stator laminations packet and the number of pole pairs on the rotor. Whilst the LSH motor incorporates the new concentrated winding, the LST motor relies on the conventional 6-pole stator winding with the well-known characteristics of a dynamic synchronous servomotor, using neodymium-iron-boron magnets.

Whilst the LST motor with its conventional "split winding" has a relatively large winding end overhang, this is eliminated on the LSH motor with its "compressed winding" technique.

Especially for motors with short lamination packets, the conventional winding end overhang on the LST can occupy half the length of the stator. This length contributes nothing to the development of torque and is eliminated on the LSH motor.

This results in a shorter motor with a higher torque and up 100 % better dynamic response. In addition, the savings in materials and manufacturing hours enable us to offer LSH motors at prices up to 20 % lower. To summarise the different characteristics:

	LSH motor type	LST motor type
Winding technique	Compressed winding technique	Conventional "split" winding
Design	10-pole rotor (exception: LSH-050 = 6-pole)	6-pole design
Nominal frequency	up to 250 Hz at 3000 rpm (exception: LSH-050 up to 225 Hz at 4500 rpm)	up to 150 Hz at 3000 rpm
Smooth running	very good	very good
Sizes	LSH-050 up to LSH-127	LST-037 up to LST-220
Moment of inertia	approx. 60 % of the LST motor	100 %
Price / performance	very good	good

## Comparison of torque characteristics

Comparison of the two characteristic curves clearly shows the higher torques delivered by the LSH motor as against the LST motor. The standstill torque of the LSH is significantly higher than the torque delivered by the LST.

The magnets of the LSH motor also permit higher maximum torque values than the magnets of the LST motor.

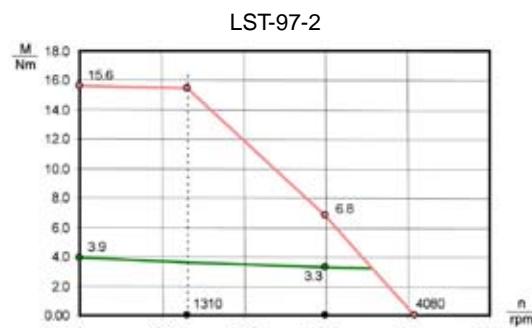

If a high dynamic response is required, the LSH motor scores well. In standard applications, the high power density of the LSH motor is conclusive. In addition the LSH motor wins on a price comparison and by virtue of its compact length.

Despite all these advantages, not all applications can be covered by the LSH motor:

Because of the high number of pole pairs on the LSH motor, it has a high nominal frequency. This means that the iron losses increase disproportionately in comparison to speed. This can clearly be seen in the sharply falling torque characteristic of the LSH.

***This comparison shows that it is your application which determines the right type of motor!***

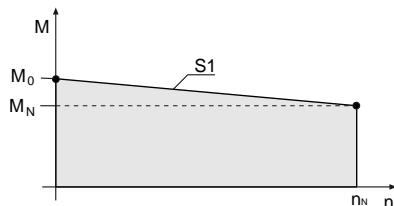

Because of its 6-pole design, the LST motor is suited primarily for applications with nominal speeds greater than 3000 rpm. Furthermore, the LST motor is the right one for extreme overloads under standstill conditions (e.g.: power press applications). When a desired moment of inertia must be matched, the LST motor can achieve better control characteristics than the more dynamic LSH motor.

## Basic configuration of servomotors

Characteristic	Synchronous servomotor LSx
Machine type	Permanent-field synchronous servomotor
Magnet material	Neodymium-iron-boron
Design (DIN 42948)	B5, V1, V3
Index of Protection (DIN 40050)	IP64, IP54 to EN 60034-5 (rotating machines), IP65 optionally available
Insulating material class	Insulating material class F to VDE 0530, winding overtemperature $\Delta t = 100^\circ\text{C}$ , ambient temperature $t_u = -20^\circ\text{C}$ to $+40^\circ\text{C}$ , non-condensing!!!
Paint finish	RAL 9005 (matt black)
Shaft end on the A side	Plain shaft (drive key and keyway DIN 6885, tolerance band k6 as option)
Smooth-running accuracy, coaxiality and concentricity to DIN 42955	Tolerance N (normal), tolerance R (reduced) on request
Thermal motor monitoring	DIN-PTC in a stator winding

In order to avoid thermal overloading of the motor, the effective load torque at medium speed should not be higher than the S1 characteristic line.

Torque load

$$M_{\text{eff}} = \frac{\sum (M_n^2 \times t_n)}{t_{\text{ges}}} \quad \bar{n} = \frac{\sum (n_n \times t_n)}{t_{\text{ges}}}$$

Maximum pulse torque	Typically 2 to 4 times nominal torque for max. 0.2 s, depending on controller assignment
Vibration severity to ISO 2373	Grade N, optionally R
Bearing service life	The average bearing life under nominal conditions ( $M_{\text{max}} \leq M_N$ ) is 20,000 h
Type of connection of motor, thermistor and holding brake	via plug-in terminals
Type of connection of encoder system	Signal plug (mating plug not supplied)

### Cooling

The specified nominal data relate to a max. ambient temperature of  $40^\circ\text{C}$  and mounting of the motor on an aluminium plate with a max. temperature of  $40^\circ\text{C}$  and installed at an altitude of max. 1000 m above MSL.

Minimum mounting face:

2.5  $\times$  area of the motor flange

Thickness of the mounting face:

min. 10 mm

If the motor is mounted with insulation (no heat dissipation via the flange) the nominal torque must be reduced.

For installation at altitudes > 1000 m above MSL the power output must be reduced by 1 % per 100 metres. The maximum installation altitude is 4000 metres.

At ambient temperatures >  $40^\circ\text{C}$  the power output must be reduced by 1 % per  $1^\circ\text{C}$ . The maximum ambient temperature is  $50^\circ\text{C}$ .

# Order code: Lust synchronous motors LSx

Example LSH-074-1-30-560

Article designation →	LSX	-	074	-	1	-	30	-	560	/	[Options] [if available]

G12.1M	Multi-turn absolute value encoder EQN 1325	analog and Endat 2.1	2048	13 bit	12 bit	from LSx-074
G12.2S	Single-turn absolute value encoder EQN 1113	analog and Endat 2.1	512	13 bit	-	from LSx-050
G12.2M	Multi-turn absolute value encoder EQN 1125	analog and Endat 2.1	512	13 bit	12 bit	from LSx-050

### Ordering example:

Motor LSH-074-1-30-560 with (DIN-PTC, brake, keyway, angled flange sockets and SRS50 encoder)  
 = LSH-074-1-30-560 / T1, B, P, S4, G6.1S

## Typical M-n characteristic of servomotors

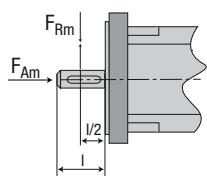

### M-n characteristic for synchronous motors

Term	Explanation
$M_0$ standstill torque	Thermally limited torque of the motor at standstill. The motor can deliver this torque for an unlimited length of time.
$I_0$ standstill current	Effective value of the motor phase current required to generate the standstill torque.
$M_N$ nominal torque	Thermally limited torque of the motor at nominal speed $n_N$ .
$I_N$ rated current	Effective value of the motor phase current required to generate the nominal torque.
$P_N$ rated power	Continuous power output of the motor at the nominal operation point ( $M_N, n_N$ ) at rated current $I_N$ and rated voltage $U_N$ .
$M_{MAX}, I_{MAX}$ limit characteristic	A maximum of four times the rated current may be applied to the motors.

## Permissible axial and lateral forces

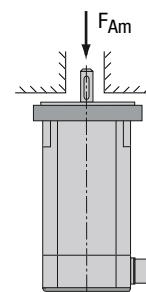

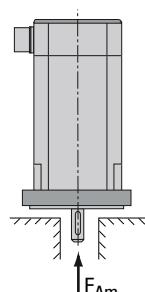

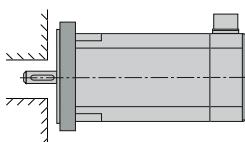

Sizes	Radial force $F_{Rm}$ [N] at speed n [rpm]					Axial force $F_{Am}$ [N] at speed n [rpm]					$F_g$
	1000	2000	3000	4500	6000	1000	2000	3000	4500	6000	
LST-037	230	185	160	140	130	44	35	31	27	24	2
LST-037/B	130	100	90	77	70	24	19	17	15	13	2
LSH-050	310	250	220	190	170	60	50	42	36	32	2
LST-050	325	260	225	195	175	62	50	43	37	34	2
LSH-074	480	380	330	290	260	90	70	63	55	50	6
LST-074	535	425	370	325	295	100	80	70	60	55	6
LSH-097	850	680	600	520	470	160	130	115	100	90	15
LST-097	920	730	640	560	510	175	140	120	105	95	18
LSH-127	970	770	670	590	530	185	145	125	110	100	34
LST-127	1000	790	690	600	550	190	150	130	115	105	34
LST-158	1020	810	710	620	560	195	155	135	120	110	60
LST-190	1950	1550	1350	1170	1070	370	290	260	225	200	100
LST-220	2500	1950	1700	1490	1350	470	370	320	280	260	200

The table indicates the max. permissible lateral force (radial force  $F_{Rm}$ ) at the point of application  $l/2$  and the max. permissible axial force  $F_{Am}$  for a service life of 20,000 h. Lateral forces applied other than in the middle of the shaft end can simply be translated to allow for the changed leverage ratios.

Either the permissible radial force or the axial force may act on the motor shaft!

### Technical data design

Design	B5	V1	V3
Shaft	Free shaft end	Free shaft end at bottom	Free shaft end at top
Attachment	Flange mounting, access from housing side	Flange mounting at bottom, access from housing side	Flange mounting at top, access from housing side

Note: If mounted vertically (V1) the permissible axial forces ( $F_{Am}$ ) are applicable. If mounted vertically upwards (V3) the permissible axial forces are reduced by the force due to the weight of the rotor ( $F_g$ ).

### The LSH motor - the power pack

Using a completely new winding technology known as concentrated winding, the new LSH generation of motors improves power density by between 30 % and 70 % compared with conventional technologies.

For the user this means up 100 % improvement in dynamic response and significantly reduced space requirements combined with smooth running.

Technical data	Standstill torque	Nominal torque	Rated current at 560 V $I_N$ [A]	Rated current at 320 V $I_N$ [A]	Nominal speed $n_N$ [rpm]

## Motor type LSH-050 ( $U_{ZK} = 320$ V)

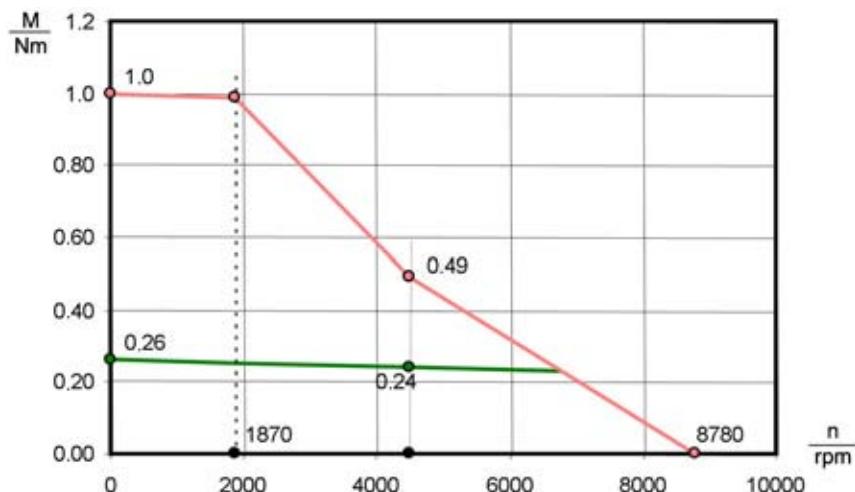

### Explanation of characteristic lines:

The upper characteristic line ( $M_{max}$ ) describes the short-time maximum possible torque at the corresponding rotation speed (important for dynamic processes).

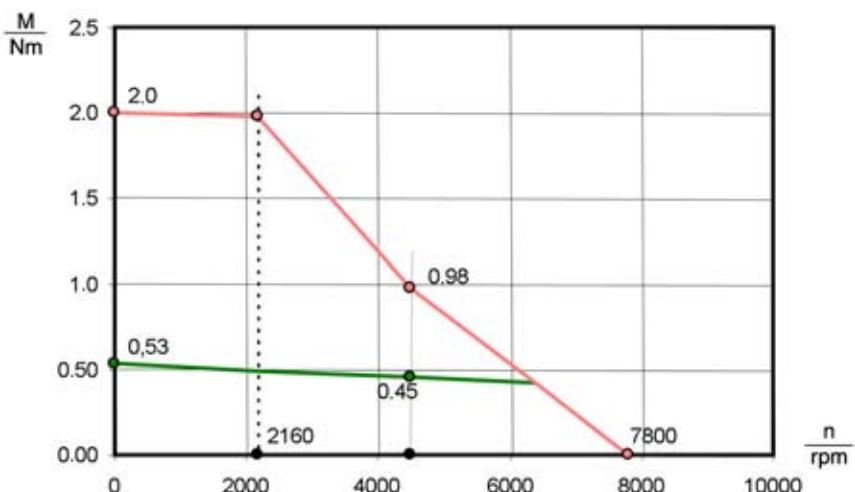

The lower characteristic line ( $M_{nenn}$ ) shows the thermally permissible continuous torque.

## Motor type LSH-074 ( $U_{ZK} = 320$ V)

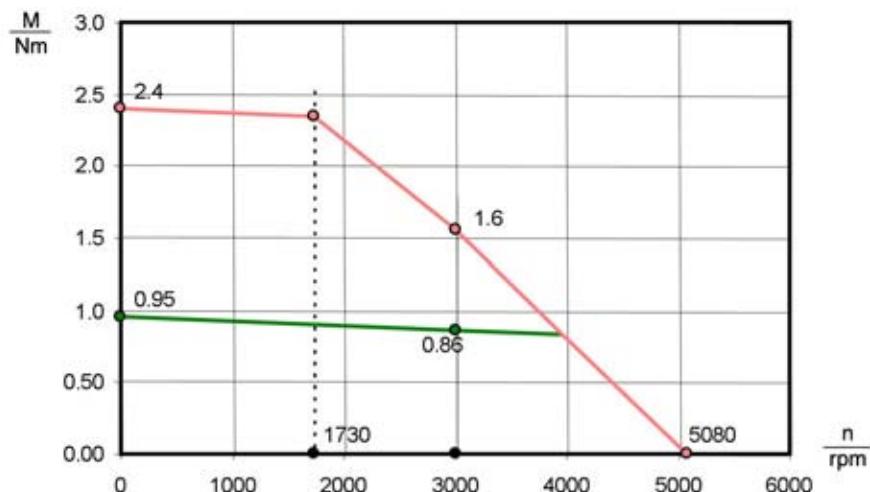

### Explanation of characteristic lines:

The upper characteristic line ( $M_{max}$ ) describes the short-time maximum possible torque at the corresponding rotation speed (important for dynamic processes).

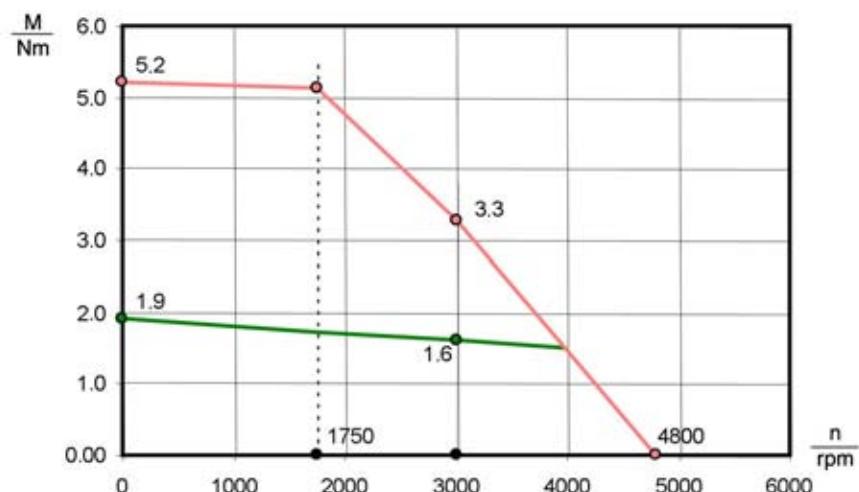

The lower characteristic line ( $M_{nenn}$ ) shows the thermally permissible continuous torque.

LST220	560 V	3 - 40

### LST motor – the versatile one

Featuring conventional winding technology, the LST motor combines all the advantages of a 6-pole synchronous servomotor.

- Well suited to speeds up to 9000 rpm. Special windings are available on request.
- High overload capacity even at standstill based on efficient heat distribution in the stator packet.
- Increased rotor moment of inertia for torque adaptation.

## Motor type LST-037 ( $U_{ZK} = 320$ V)

### Explanation of characteristic lines:

The upper characteristic line ( $M_{max}$ ) describes the short-time maximum possible torque at the corresponding rotation speed (important for dynamic processes).

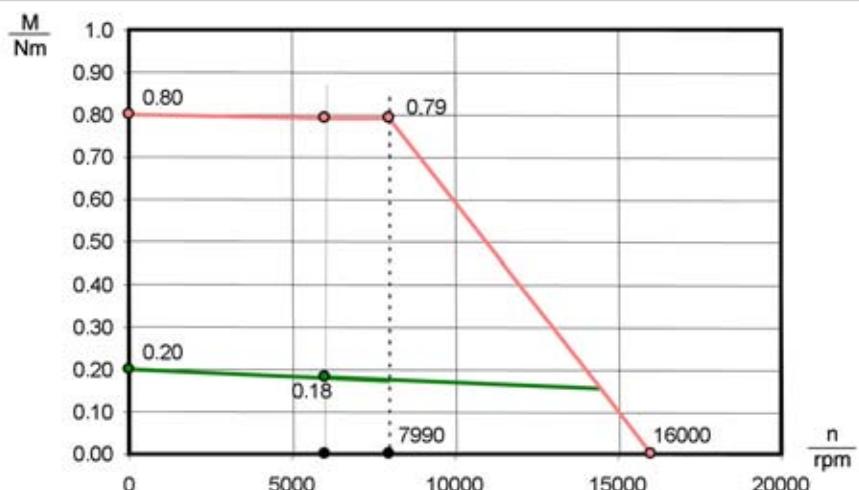

The lower characteristic line ( $M_{nenn}$ ) shows the thermally permissible continuous torque.

## Motor type LST-097 ( $U_{ZK} = 560$ V)

### Explanation of characteristic lines:

The upper characteristic line ( $M_{max}$ ) describes the short-time maximum possible torque at the corresponding rotation speed (important for dynamic processes).

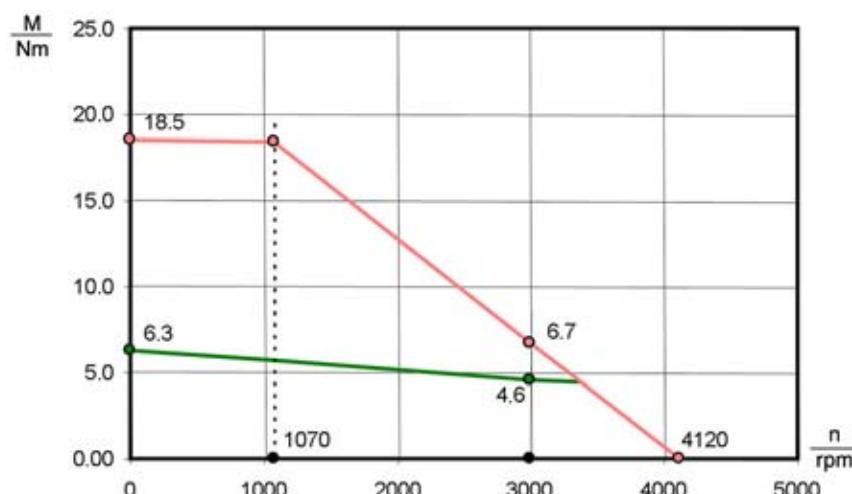

The lower characteristic line ( $M_{nenn}$ ) shows the thermally permissible continuous torque.

## LSx servomotors with 24 V and 48 V windings, overview

Typ	$U_{DC}$	Page
LST-037	24/48 V	4 - 2
LSH-050	24/48 V	4 - 6
LSH-74	24/48 V	4 - 10

### LSx- motors – for functional extra-low voltage

The servomotors in the LSH and LST ranges are also available with motor windings for functional extra-low voltage to IEC 364 (VDE 0100, part 410). Together with the CDF3000 servo controller, they offer the optimum combination for this voltage range.

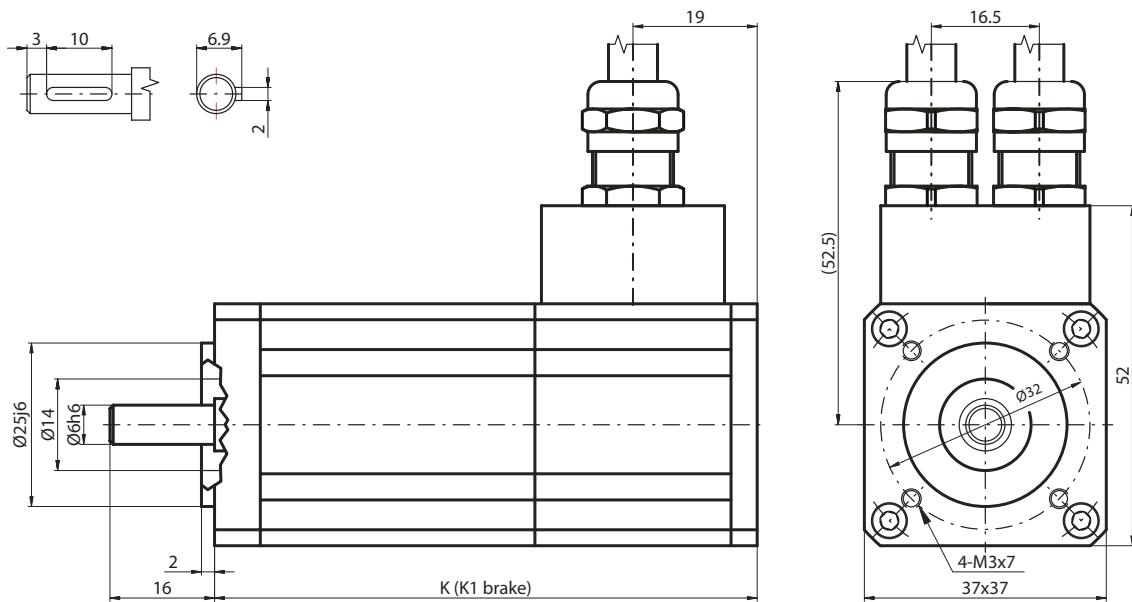

Technical data, motor	Standstill torque $M_0$ [Nm]	Nominal torque $M_N$ [Nm]	Rated cur- rent at 24 V $I_N$ [A]	Rated cur- rent at 48 V $I_N$ [A]	Nominal speed $n_N$ [rpm]

## Motor type LST-037-x-xx-24

### Explanation of characteristic lines:

The upper characteristic line ( $M_{\max}$ ) describes the short-time maximum possible torque at the corresponding rotation speed (important for dynamic processes).

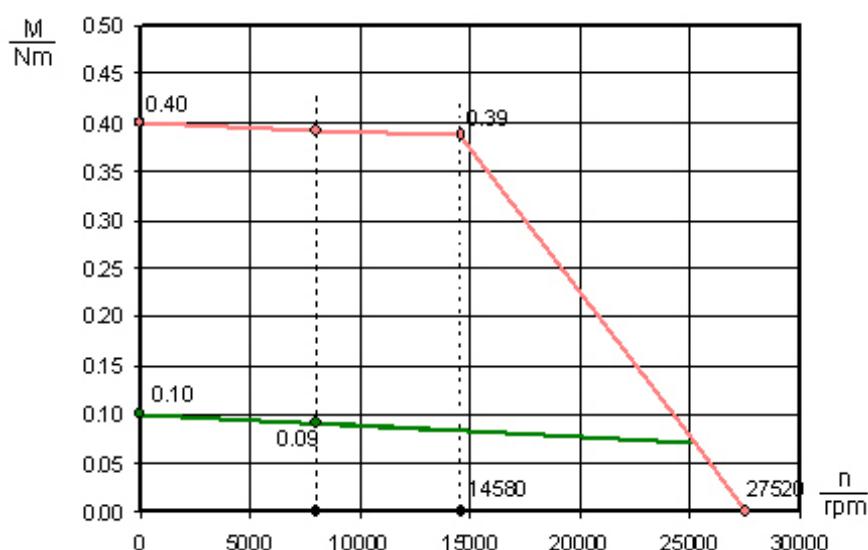

The lower characteristic line ( $M_{\text{enn}}$ ) shows the thermally permissible continuous torque.

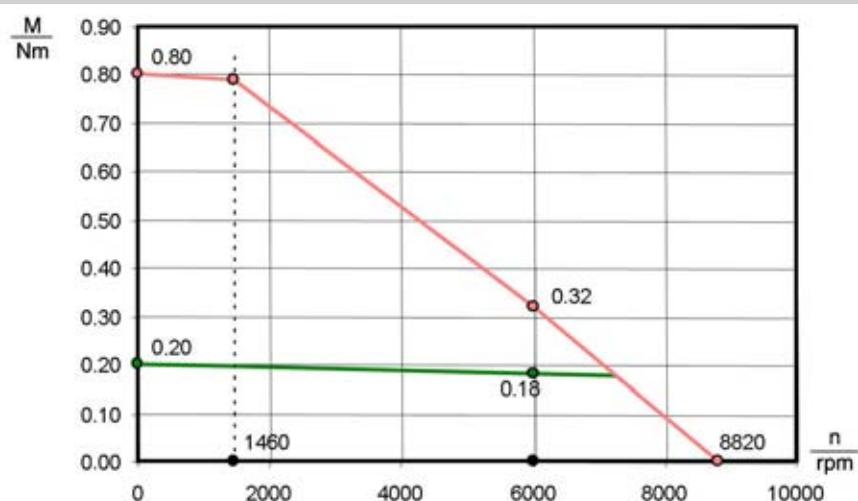

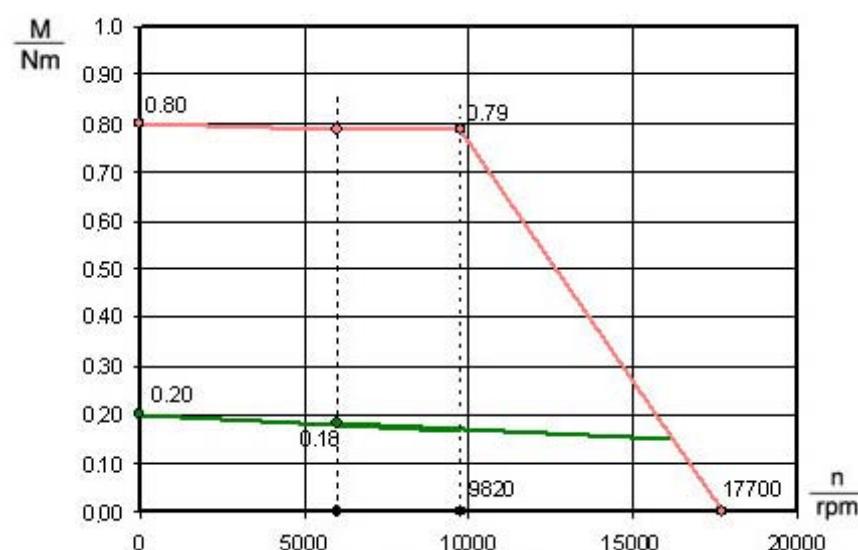

The motors can be operated at either 24 V or 48 V.

LST-037-1-80-24  $U_{ZK} = 24 \text{ V}$

LST-037-1-80-24  $U_{ZK} = 48 \text{ V}$

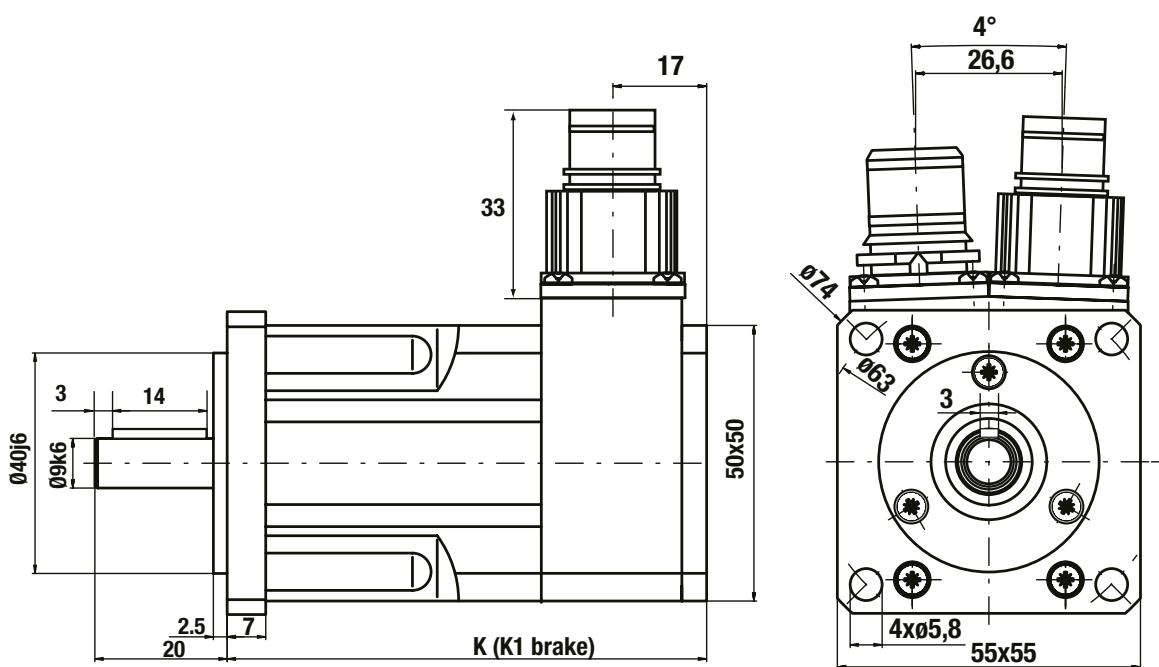

LST-037-2-60-24  $U_{ZK} = 24 \text{ V}$ LST-037-2-60-24  $U_{ZK} = 48 \text{ V}$ 

## Motor type LSH-050-x-30-48 ( $U_{ZK} = 24 \text{ V}$ )

## Motor type LSH-050-x-30-48 ( $U_{ZK} = 24 \text{ V}$ )

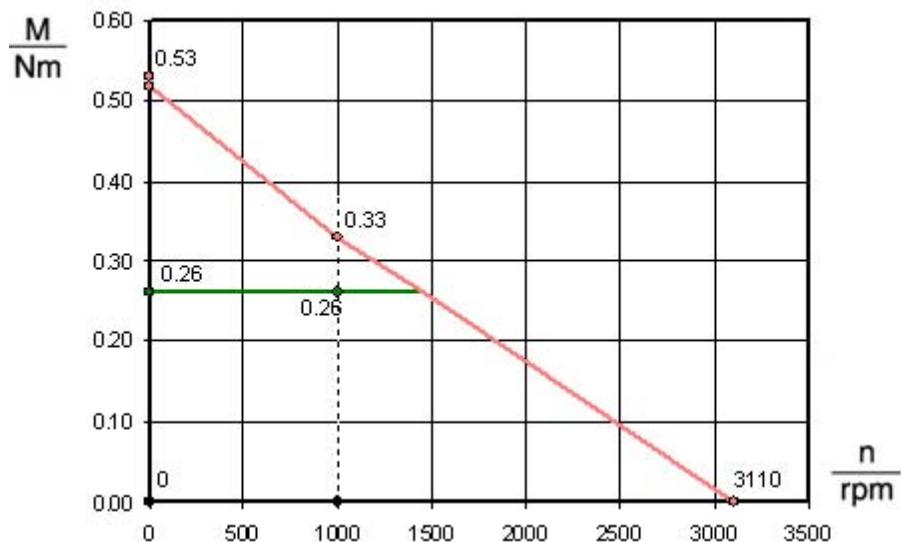

### Explanation of characteristic lines:

The upper characteristic line ( $M_{\max}$ ) describes the short-time maximum possible torque at the corresponding rotation speed (important for dynamic processes).

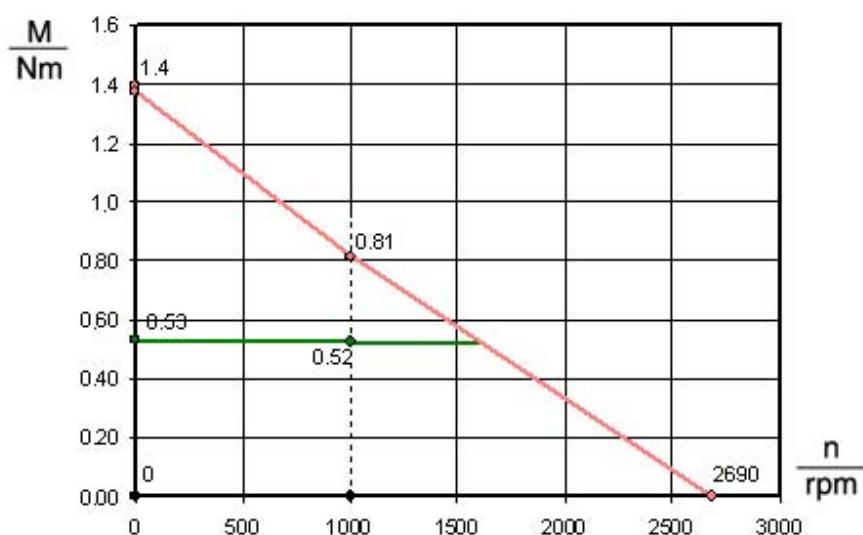

The lower characteristic line ( $M_{\text{nenn}}$ ) shows the thermally permissible continuous torque.

The motors can be operated at either 24 V or 48 V.

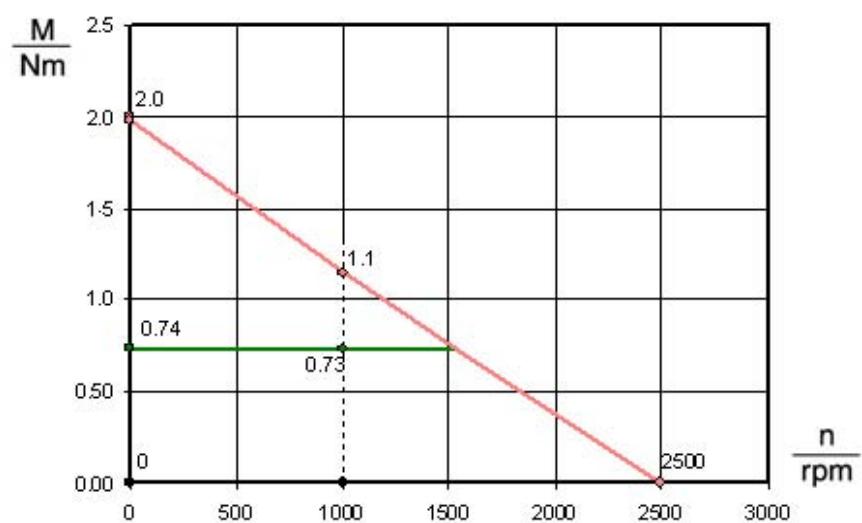

LSH-050-1-30-48  $U_{ZK} = 24 \text{ V}$

LSH-050-2-30-48  $U_{ZK} = 24$

LSH-050-3-30-48 U<sub>ZK</sub> = 24 V

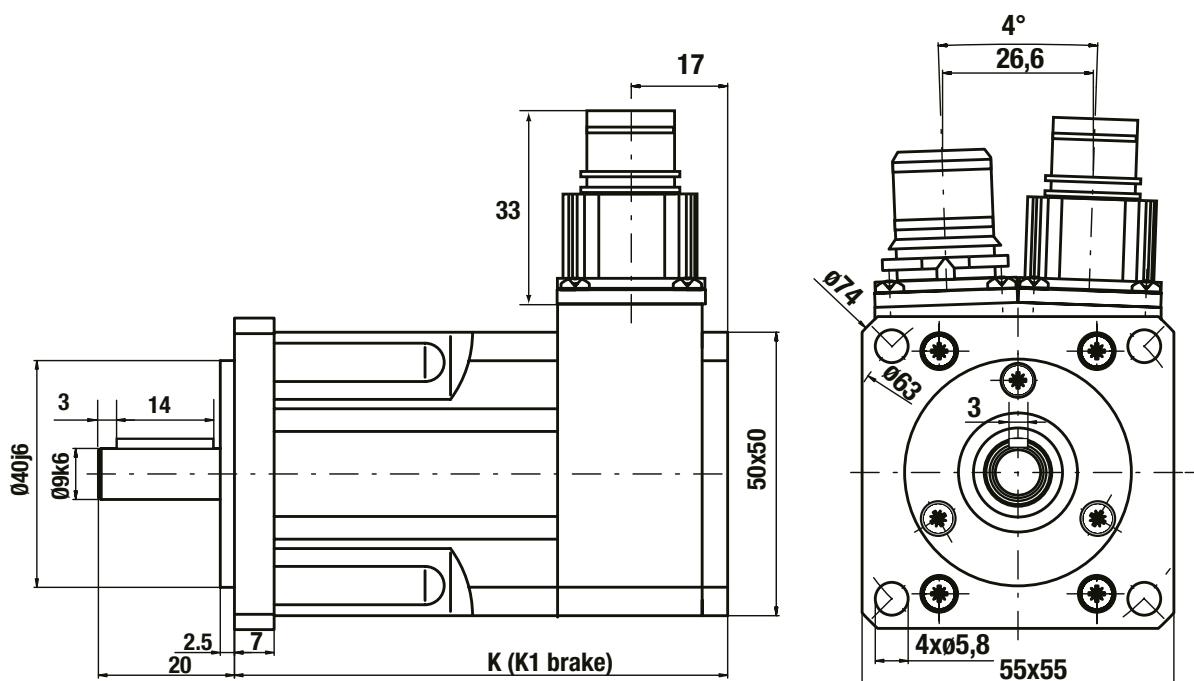

## Motor type LSH-050-x-30-48 ( $U_{ZK} = 48$ V)

### Holding brake

An LSH servomotor with holding brake is identifiable by the name plate.

Example: LSH-074-1-30-560/T1, B

The backlash-free, permanent-field single-disc holding brake works on the closed circuit principle, meaning that current needs to be applied to the brake to release it.

For optimum holding torque and least possible torsional play the holding brake is mounted directly behind the flange (A-end) on all LSx motors.

The holding brake is always activated and deactivated at standstill. When the holding brake is deployed as an emergency stop brake, you need to take account of the maximum permissible frictional work (WR).

**i** When the holding brake is deployed as an emergency stop brake, the braking torque may be substantially lower than the holding torque.

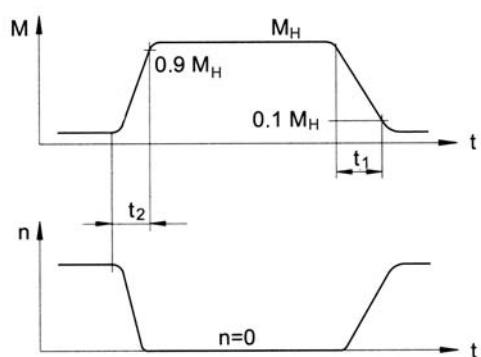

### Holding brake response times

Triggered from the AC side:

Is performed before the rectifier on the AC side. Here the magnetic field decays slowly and the brake releases gently with a delay (switch-off time  $t_2 \approx$ ).

Triggered from the DC side:

Is performed between the rectifier and the solenoid coil, thus achieving an extremely short time-lag. For all drives that require precise braking, in particular for lifting gear, DC side triggering of the brake is absolutely essential (switch-off time  $t_2 =$ ).

M	Braking torque	t	Time
$M_H$	Holding torque of the spring pressure brake	$t_1$	Activation time
N	Speed	$t_2$	Deactivation time
