Nuove normative riguardanti l'efficienza

La Commissione IEC ha introdotto due nuove normative riguardanti l'efficienza energetica dei motori:

- IEC 60034-2-1 che specifica i criteri che definiscono i metodi di prova relativi al calcolo dell'efficienza
- IEC 60034-30 che definisce le nuove classi di efficienza dei motori.

IEC 60034-2-1; 2007

Il nuovo standard IEC 60034-2-1, entrato in vigore a settembre 2007, introduce nuove regole relative ai metodi di prova da utilizzare per la determinazione delle perdite e dell'efficienza.

Ci sono due modalità di determinazione dell'efficienza: il metodo diretto ed il metodo indiretto. Per il metodo indiretto la nuova norma specifica i seguenti parametri:

- la temperatura di riferimento
- tre opzioni per la determinazione delle perdite di carico supplementari: misurazione, stima e calcolo matematico.

Il nuovo standard Electro Adda Spa utilizza il metodo indiretto di calcolo, e le perdite di carico supplementari determinate dalla misurazione.

I valori di efficienza derivati sono diversi da quelli risultanti dal precedente standard di prova IEC 60034-2-1996. E' da notare che i valori di efficienza sono comparabili solo se misurati con lo stesso metodo.

La documentazione del motore deve indicare il metodo utilizzato.

I valori di rendimento nelle pagine dei dati tecnici di questo catalogo, sono dati secondo entrambe i metodi di calcolo vecchio e nuovo.

Di seguito sono mostrate le differenze tra vecchio e nuovo standard.

Vecchio metodo di prova standard IEC 60034-2-1996:

Metodo diretto

Metodo indiretto:

- PLL (perdite addizionali) stimato al 0.5 % della potenza in ingresso a carico nominale.

Le perdite nello statore e nel rotore sono determinate a 95°C.

Nuovo metodo di prova standard IEC 60034-2-1-2007:

Metodo diretto

Metodo indiretto:

- Misurazione: PLL calcolato da prove di carico;
- Stima: PLL dal 2,5% al 1,0% di potenza in ingresso a carico nominale compresa tra 0,1 kW e 1000 kW;
- Matematica: metodo alternativo indiretto per il calcolo matematico del PLL. Le perdite nello statore e nel rotore sono determinate a 25°C + temperatura reale misurata.

New standards concerning efficiency

The IEC Commission introduced two new standards concerning energy efficient motors.

- IEC/EN 60034-2-1 specifies new rules concerning efficiency testing methods;
- IEC 60034-30 defines new efficiency classes for motors.

IEC/EN 60034-2-1; 2007

The new standard IEC/EN 60034-2-1, which came into force September 2007, introduces new rules concerning the testing methods to be used for determining losses and efficiency.

It offers two ways of determining the efficiency; direct method and indirect method. The new standard specifies following parameters for determining the efficiency according to indirect method:

- reference temperature
- three options for determining additional load losses: measurement, estimation and mathematical.

The new Electro Adda SpA standard uses the indirect calculation method, additional load losses are determined from measuring.

The resulting efficiency values differ from those obtained under the previous IEC 60034-2-1996 testing standard. It must be noted that efficiency values are only comparable if they are measured using the same method.

The motor documentation must state which method is used.

The efficiency values on the technical data pages in this catalogue are given according to both new and old calculation methods.

The table below shows the differences between old and new standard.

Old efficiency testing standard EN/IEC 60034-2-1996

Direct method

Indirect method:

- PLL (= additional losses) estimated at 0.5 % of input power at rated load.

Winding losses in stator and rotor determined at 95°C.

New efficiency testing standard IEC/EN 60034-2-1-2007

Direct method

Indirect method:

- Measurement; PLL calculated from load tests
- Estimation; PLL at 2.5% - 1.0% of input power at rated load between 0.1 kW and 1000 kW
- Mathematical calculation; alternative indirect method with mathematical calculation of PLL. Winding losses in stator and rotor determined at 25°C + actual measured temperature.

IEC 60034-30; 2008

La norma IEC 60034-30 ottobre 2008 definisce tre classi di efficienza IE (International Efficiency) per motori asincroni trifasi a gabbia e singola velocità.

- **IE1 = Efficienza standard** (livelli di efficienza più o meno equivalenti a EFF2 in Europa al giorno d'oggi)
- **IE2 = Alta efficienza** (livelli di efficienza più o meno equivalenti a EFF1 in Europa oggi e identico a EPAct in USA per 60 Hz)
- **IE3 = Efficienza Premium** (nuova classe di efficienza in Europa oggi e identico a "NEMA Premium" negli Stati Uniti per 60 Hz)

La norma IEC 60034-30 copre quasi tutti i tipi di motori (standard, zona pericolosa, marina, autofrenanti):

- Singole velocità, trifase, 50 e 60 Hz
- 2, 4 o 6 poli
- Potenza nominale in uscita da 0.75 a 375 kW
- Tensione nominale Un fino a 1000 V
- Tipo di servizio S1 (funzionamento continuo) o S3 (servizio intermittente periodico), con un fattore nominale di intermittenza dell'80% o superiore In grado di funzionare direttamente in linea

I seguenti motori sono esclusi dalla IEC 60034-30:

- Motori per il funzionamento con convertitori
- Motori integrati in una macchina (per es. pompe, ventilatori o compressori) che non possono essere provati separatamente da essa.

Valori limite di efficienza IEC 60034-30 standard ottobre 2008 sulla base di IEC 60034-2-1; 2007 standard – **Funzionamento a 50 Hz**

IEC 60034-30; 2008

IEC 60034-30: October 2008 defines three IE (International Efficiency) efficiency classes of single speed, three phase, cage induction motors.

- **IE1 = Standard efficiency** (efficiency levels roughly equivalent to EFF2 in Europe nowadays)
- **IE2 = High efficiency** (efficiency levels roughly equivalent to EFF1 in Europe nowadays and identical to EPAct in USA for 60 Hz)
- **IE3 = Premium efficiency** (new efficiency class in Europe nowadays and identical to "NEMA Premium" in the USA for 60Hz)

IEC 60034-30 covers almost all motors (for example standard, hazardous area, marine, brake motors):

- Single-speed, three-phase, 50 Hz and 60 Hz
- 2, 4 or 6-pole
- Rated output from 0.75 to 375 kW
- Rated voltage UN up to 1000 V
- Duty type S1 (continuous duty) or S3 (intermittent periodic duty) with a rated cyclic duration factor of 80% or higher capable of operating direct online

Following motors are excluded from IEC 60034-30:

- Motors made solely for converter operation
- Motors completely integrated into a machine (for example, pump, fan and compressor) that cannot be tested separately from the machine

Efficiency limit values acc. to IEC 60034-30; October 2008 standard; based on IEC 60034-2-1; 2007 standard - **50 Hz mains supply frequency**

I livelli di rendimento definiti dalla norma IEC 60034-30 sono basati sui metodi di prova specificati nella IEC 60034-2-1.2007. Rispetto alle vecchie classi di efficienza, secondo l'accordo CEMEP, il campo di applicazione è stato esteso

Efficiency levels defined in IEC 60034-30 are based on tests methods specified in IEC 60034-2-1: 2007. Compared to old efficiency classes acc. to CEMEP agreement the scope been expanded

REGOLAMENTO (CE) N.640/2009 DELLA COMMISSIONE del 22 luglio 2009

Il regolamento N640/2009 prescrive:

A) a partire dal 16 giugno 2011 i motori devono avere come minimo un livello di efficienza IE2, quale definito all'allegato I, punto

B) a partire dal 1 o gennaio 2015:

i) i motori con una potenza nominale compresa tra 7,5 e 375 kW devono avere come minimo il livello di efficienza IE3, oppure il livello di efficienza IE2, e devono essere muniti di variatore di velocità;

C) a partire dal 1 o gennaio 2017: i) tutti i motori con una potenza nominale compresa tra 0,75 e 375 kW devono avere come minimo il livello di efficienza IE3, , oppure il livello di efficienza IE2, e devono essere muniti di variatore di velocità.

Tale regolamento si applica a:

- un motore elettrico a induzione a gabbia, monovelocità e trifase, con una frequenza di 50 Hz o 50-60 Hz
- da 2 a 6 poli,
- una tensione nominale (UN) massima di 1 000 V,
- una potenza nominale (PN) compresa tra 0,75 kW e 375 kW,
- caratteristiche basate su un funzionamento in continuo;

REGULATION (EC) No. 640/2009 OF THE COMMISSION of July 22, 2009

The regulation no. 640/2009 provides:

A) as from June 16, 2011, motors shall have at least an IE2 efficiency level , as defined in Annex I, point

B) as from January 1, 2015:

i) motors with a rated output between 7,5 and 375 kW must have at least the IE3 efficiency level, or the IE2 efficiency level, and must be equipped with a speed variator;

C) as from January 1, 2017 : i) all motors with a rated output between 0.75 and 375 kW must have at least the IE3 efficiency level , or the IE2 efficiency level , and must be equipped with a speed variator .

This Regulation shall apply to:

- an induction electric motor with cage rotor, single-speed and three-phase with a frequency of 50 Hz or 50-60 Hz
- from 2 to 6 poles,
- a maximum rated voltage (UN) of 1000 V ,
- rated nominal power (PN) between 0,75 kW and 375 kW ,
- features based on a continuous operation;

Caratteristiche generali**Motori ad alta efficienza**

I motori della serie MAR con altezza d'asse da 63÷500, sono del tipo chiuso, con ventilazione esterna e hanno il rotore a gabbia di scoiattolo.

I motori grandezza 63 ÷ 355LT sono caratterizzati dall' avere la carcassa realizzata in lega leggera di alluminio ad alta resistenza .

I motori grandezza 355L ÷ 500 sono caratterizzati dall' avere la carcassa realizzata in acciaio.

General features**High efficiency motors**

MAR line motors frame size 63÷500 are totally enclosed, fan cooled, with squirrel cage rotor.

Motors frame size 63÷355LT are provided with high resistance aluminium light alloy frame .

Motors frame size 355L÷500 are provided with steel frame).

Tutti i motori serie C sono progettati, realizzati, assemblati e collaudati presso il ns. stabilimento di BEVERATE di BRIVIO - Lecco - ITALY.

All C line motors are designed, manufactured, assembled and tested at our works in BEVERATE di BRIVIO - Lecco - ITALY.

Norme, Unificazioni

I motori serie MAR conformi alle prescrizioni emesse dagli enti di classificazione:

Registro Italiano Navale
Lloyds Register of Shipping
Bureau Veritas
American Bureau of Shipping
Det Norske Veritas

I motori serie MAR sono conformi alle seguenti Norme e Direttive:

Standards and standardizations

MAR line motors are in compliance with the prescriptions issued by the following Classification Bodies:

*Registro Italiano Navale
Lloyds Register of Shipping
Bureau Veritas
American Bureau of Shipping
Det Norske Veritas*

C line motors comply with the following Standards and Directives:

Le unificazioni UNEL concordano con le norme internazionali IEC, pubblicazione 72, e relativo Emendamento N° 1.

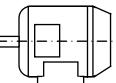

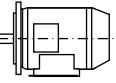

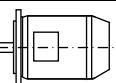

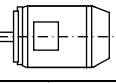

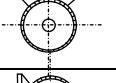

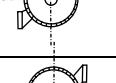

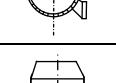

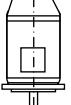

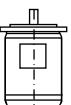

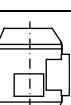

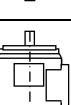

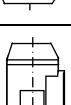

The UNEL standardizations are in accordance with the IEC international standards publication 72 and relative Amendment No. 1.

Forme costruttive

Le forme costruttive secondo IEC 60034-7 relative ai motori standard sono indicate con i codici elencati nella seguente tabella

Mountings and positions

Mountings and positions for standard motors, according to IEC 60034-7, are defined by the codes mentioned in the following table

Figura	NORME DI RIFERIMENTO STANDARDS			ALTEZZE D'ASSE FRAME SIZES			
	CEI 2-14	IEC 60034-7		63+160	180+250	280 + 355LT	355L + 500

Grado di protezione

I motori serie MAR, in accordo con le Norme IEC 60034-5, hanno i seguenti gradi di protezione:

IP 55 (di serie). Motori chiusi con ventilazione esterna protetti alla penetrazione di polvere e getti d'acqua provenienti da ogni direzione

IP 56 (a richiesta). Motori stagni protetti alla penetrazione della polvere e contro le ondate per funzionamento sopracoperta.

A richiesta i motori possono essere forniti senza ventilazione (IC410). In quest'ultimo caso le caratteristiche, le potenze e i dati tecnici, saranno forniti a richiesta.

La ventola esterna è coperta da una calotta avente grado di protezione IP 20 (cioè è protetta contro l'accesso involontario delle dita).

A richiesta, i motori previsti per l'installazione con asse verticale con albero verso il basso, vengono forniti con il tettuccio di protezione. La scatola morsettiera ha il grado di protezione IP 55 o IP 56.

Degrees of protection

MAR line motors, according to IEC 60034-5 Standards, have the following protection degrees

IP 55 (standard) totally enclosed motors, fan cooled, protected against penetration of dust and water splashes coming from any direction

IP 56 (upon request) totally enclosed motors, protected against dust penetration and against sea waves, for use on deck.

Upon request motors can be supplied without fan (IC410). In this case features, outputs and technical data will be supplied upon request.

The external fan is covered by a fan cover with IP 20 protection degree (accidental contact of fingers is avoided).

Upon request, motors for vertical mounting, can be supplied with rain cowl.

The terminal box has IP 55 or IP56 protection degree.

Particolari costruttivi

I motori serie MAR sono stati progettati e vengono realizzati in modo da assicurare la massima affidabilità e sicurezza d'esercizio.

I motori serie C grandezze 63÷355LT hanno la carcassa realizzata in alluminio.

I motori grandezza 63÷200T hanno gli scudi e le flange realizzate in alluminio, mentre i motori 200÷355LT hanno gli scudi e le flange realizzati in ghisa.

La scatola copri morsettiera, realizzata in alluminio, è posta sopra al motore ed è ruotabile di 90° in 90°.

A richiesta la scatola morsetti può essere posta lateralmente al motore.

La calotta copriventola è metallica in lamiera o in alluminio.

Le ventole sono realizzate in materiale plastico autoestinguente, in alluminio o in acciaio..

Construction

MAR line motors have been designed and manufactured to guarantee maximum operating reliability and safety.

C line motors frame size 63÷355LT are provided with aluminium frame..

Motors frame size 63÷200T are provided with aluminium shields and flanges while motors frame size 200÷355LT have cast iron shields and flanges.

The terminal box, made in aluminium, is positioned on top of the motor and it can be rotated in step of 90°.

Upon request the terminal box can be positioned on the side of the motor.

The fan cover is in metal, in steel sheet or aluminium.

Fans are made in self-extinguishing plastic, aluminium or steel.

	Grandezza / Frame size						
	63 ÷ 132	160 ÷ 200T	200 ÷ 355LT	355 ÷ 400	400 ÷ 500		
Carcassa / Frame	Alluminio / Aluminium			Acciaio / Steel			
Scudo LA / Front (DE) shield	Alluminio / Aluminium	Ghisa / Cast iron	Ghisa / Cast iron	Acciaio / Steel

Flangia / Flange	Alluminio / Alluminum	Ghisa / Cast iron		Ghisa / Cast iron	Acciaio / Steel		
Albero / Shaft	Acciaio C43 / Steel C43						
Scatola morsetti/ Teminal box	Alluminio / Aluminium			Acciaio / steel			
Ventola / Fan	Alluminio / Aluminium			Acciaio / steel			

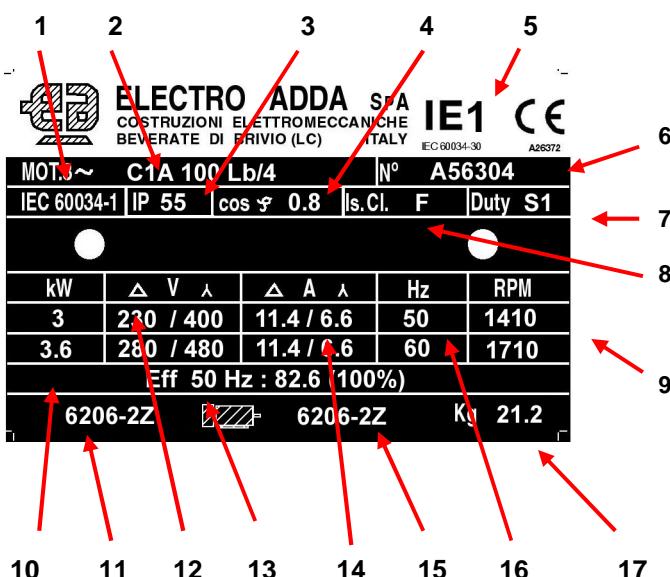

Targhe

Tutti i motori in esecuzione standard sono forniti con targa in alluminio o a richiesta in acciaio inossidabile.

Tutte le targhe, realizzate mediante incisione laser, riportano i dati caratteristici della macchina elettrica in accordo con le norme di riferimento, i tipi di cuscinetti e i dati di ingrassaggio.

Per i motori grandezza 63 ÷ 250 viene posta un'unica targa.

Per i motori serie CA grandezza 280 ÷ 500 viene posta una targa aggiuntiva con i dati relativi alla lubrificazione.

1	Norma di riferimento	Reference standard
2	Codice motore	Motor code
3	Grado di protezione IP	Protection degrees IP
4	Cosfi	Power factor
5	Classificazione secondo IEC 60034-30	Classification according to IEC 60034-30
6	Numero di matricola	Serial number
7	Servizio	Duty
8	Classe di isolamento	Insulation class
9	Velocità di rotazione	Speed
10	Potenza (kW)	Power (kW)
11	Cuscinetto lato opp accoppiamento	Non drive end bearing
12	Tensione di alimentazione	Voltage
13	Rendimenti a vari carichi	Efficency
14	Corrente assorbita (A)	Current (A)
15	Cuscinetto lato accoppiamento	Drive end bearing
16	Frequenza	Frequency
17	Peso	Weight
18	Tipo di grasso	Grease type
19	Intervallo di lubrificazione (ore)	Lubrication intervals (hours)
20	Quantitativo grasso cusc. LA	Grease quantity DE bearing
21	Quantitativo grasso cusc. LOA	Grease quantity NDE bearing
22	Velocità di riferimento	Reference speed

A richiesta del cliente possono essere aggiunte targhe speciali riportanti caratteristiche particolari. Per esempio: Item di impianto ecc..

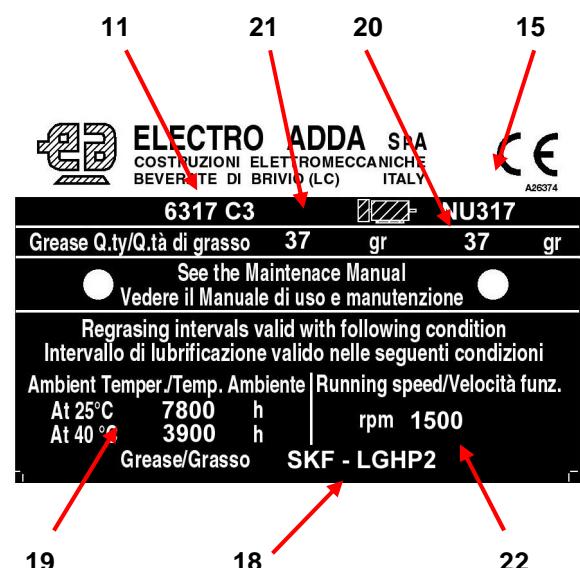

Rating Plates

All motors in standard execution are supplied with aluminium rating plate or, upon request, with stainless steel rating plate.

All rating plates, made by laser engraving, contain the distinctive data of the electric machine according to the reference standards, the bearing types and the regreasing data.

Motors frame size 63 ÷ 250 are provided with only one rating plate.

Motors frame size 280 ÷ 500 and are provided with an additional rating plate containing the regreasing data.

Upon customer's request, special rating plates mentioning particular features can be added. For example: system item etc.

Raffreddamento

La definizione del metodo di raffreddamento è data dal codice IC (International Cooling), in accordo alla IEC 60034-6.

Codice I (Semplificato)	IC	4	1	1
Disposizione del circuito				
Metodi di circolazione del fluido di raffreddamento primario.				
Metodi di circolazione del fluido di raffreddamento secondario.				

I motori in esecuzione standard sono caratterizzati dal metodo di raffreddamento IC 411, con ventola radiale bidirezionale.

Tutti i motori possono essere forniti con sistema di raffreddamento IC 416 su richiesta (vedere pag. 85)

In tal caso viene installato un opportuno ventilatore nel copriventola adeguatamente rinforzato, in modo da rendere la ventilazione indipendente dalla velocità di rotazione.

A richiesta possono essere forniti motori con sistema di raffreddamento IC418; in tal caso il motore viene fornito senza ventola ed il raffreddamento è garantito da un flusso d'aria che lambisce il motore stesso. Qualora il flusso d'aria sia sufficientemente elevato è possibile aumentare la potenza erogata dal motore.

Per gli aumenti di potenza consentiti in questa configurazione è necessario interpellare ELECTRO ADDA SpA

Cooling

The designation of cooling method is given by the IC (International Cooling) code, according to IEC60034-6

Code I (Simplified)	IC	4	1	1
Circuit Arrangement				
Method of fluid circulation for the secondary cooling fluid.				
Method of fluid circulation for the primary cooling fluid.				

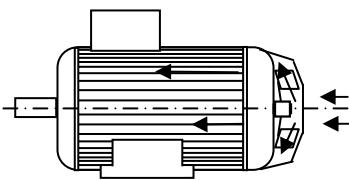

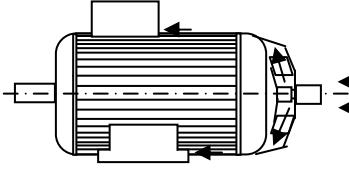

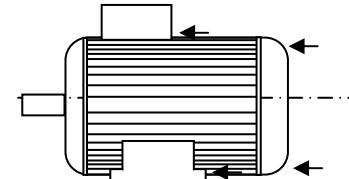

Motors in standard execution are supplied with IC 411 cooling systems, incorporating a bi-directional fan.

All frame sizes can be supplied with cooling system IC 416 on request (see page 85).

In this case a proper fan is fitted inside the fan cover, suitably reinforced, in order to make the ventilation independent of the rotation speed.

On request motors with IC418 cooling systems can be supplied; in such case the motor is supplied without fan and the cooling is ensured by a flow of air that flows around the motor itself. If the airflow is high enough it is possible to increase the power delivered by the motor.

For power increases allowed in this configuration, please ask ELECTRO ADDA SpA

Codice IC / IC code	Figura	Descrizione	Description
IC 411 Std		Motore autoventilato Macchina chiusa, alettata esternamente. Ventola esterna montata sull'albero del motore.	<i>Self ventilating motor. Enclosed machine. Externally finned. External shaft-mounted fan.</i>
IC 416 Su richiesta Upon request		Motore con ventilazione assistita. Macchina chiusa, alettata esternamente. Ventilatore indipendente montato sotto copriventola.	<i>Motor with assisted ventilation. Enclosed machine. Externally finned. Independent external fan mounted inside the fan cover.</i>
IC 418 Su richiesta Upon request		Motore con ventilazione esterna. Macchina chiusa, alettata esternamente. Raffreddamento assicurato da un dispositivo non montato sul motore.	<i>Motor with external ventilation. Enclosed machine. Externally finned. Ventilation provided by air flowing from the driven system.</i>

A richiesta i motori possono essere forniti anche senza ventilazione (IC 410). In quest'ultimo caso le caratteristiche, le potenze e i dati tecnici, saranno forniti a richiesta.

Upon request they can be supplied without fan. (IC410). In this case the features, outputs and technical data will be supplied upon request.

Cuscinetti

Tutti i motori serie MAR hanno i cuscinetti a sfere (radiali od obliqui) od a rulli, lubrificati a grasso.

I motori grandezze 63 ÷ 250 hanno i cuscinetti a sfere stagni prelubrificati. Il grasso contenuto all'interno è sufficiente per tutta la vita del cuscinetto, pertanto non necessitano di rilubrificazione.

I motori grandezze 280 ÷ 500 hanno i cuscinetti a sfere (radiali od obliqui) o a rulli, lubrificati a grasso con ingassatori su ambo i lati. Per questi cuscinetti è necessario provvedere ad una periodica rilubrificazione secondo i dati indicati nella tabella di pagina 22 e sulla targa del motore, e secondo le modalità indicate nel manuale di uso e manutenzione

I coperchietti esterni sono di forma e dimensioni tali da consentire un elevato accumulo di grasso esausto (10 - 12 lubrificazioni) e sono dotati di tappo di scarico.

A richiesta i motori, a partire dalla grandezza 160, possono essere forniti con cuscinetto a rulli lato accoppiamento.

Sui motori verticali viene installato superiormente un apposito cuscinetto reggispinga in grado di reggere il peso del motore e di un eventuale giunto di accoppiamento.

A richiesta le macchine possono essere predisposte per il sistema di monitoraggio SPM (Shock Pulse Method) su entrambi i cuscinetti.

A richiesta possono essere installati su entrambi i cuscinetti termometri Pt-100 per controllare la loro corretta temperatura.

Tutti i cuscinetti sono previsti per una durata di funzionamento (in base ai dati dei fabbricanti) di almeno 40.000 ore, con accoppiamento diretto.

Bearings

All MAR line motors have ball bearings (radial or oblique) or roller bearings, grease lubricated.

Motors frame size 63 ÷ 250 have sealed prelubricated bearings. The grease contained inside is sufficient for the whole bearing life, therefore they do not need to be relubricated.

Motors frame size 280 ÷ 500 have ball bearings (radial or oblique) or roller bearings, grease lubricated, with lubricators on both sides. These bearings need to be periodically relubricated according to the data given in the table on page 22 and on the motor name plate, and according to the directions given in the operating and maintenance manual.

The shape and dimensions of the bearing outer covers allow a high exhausted grease accumulation (10 - 12 lubrications) and are provided with drain plug.

Upon request , starting from size 160, motors can be supplied with roller bearing on the drive end.

On vertical motors a proper thrust bearing is fitted on top, able to hold the weight of the motor and of a coupling, if available.

Upon request, machines can be prepared for fitting the SPM monitoring system (Shock Pulse Method) on both bearings.

Upon request, Pt-100 thermometers can be fitted on both bearings, in order to check the correct bearing temperature.

The lifetime of bearings (in accordance with supplier data) is at least 40.000 hours, for motors with direct coupling.

Posizionamento assiale del rotore

Il rotore può scorrere assialmente a seconda del tipo di cuscinetto installato e dal posizionamento delle molle di precarico. Nella tabella è indicato quale cuscinetto è bloccato e la posizione delle molle di precarico.

Grandezza Frame size	Disposizione orizzontale Horizontal arrangement			Disposizione verticale Vertical arrangement	
	Cuscinetto bloccato Constrained bearing		Posizionamento molle di precarico Preloading springs position	Cuscinetto bloccato Constrained bearing	Posizionamento molle di precarico Preloading springs position

Carichi ammessi sui cuscinetti

La durata di base teorica a fatica dei cuscinetti è calcolata in accordo con quanto previsto dalla norma ISO R 281-1.

La durata è calcolata nell'ipotesi che i motori siano funzionanti in condizioni ambientali normali, senza vibrazioni anomale, senza carichi assiali o radiali oltre quelli indicati nelle tabelle successive e con temperature di funzionamento dei cuscinetti comprese tra -30 e +85 C°.

La durata così calcolata viene definita durata di base (L_{10h}) espressa in ore di funzionamento.

Il 50% dei cuscinetti raggiunge una durata pari a cinque volte la durata di base risultante dal calcolo.

Nelle tabelle seguenti sono indicati i massimi carichi assiali e radiali ammessi per una durata di base (L_{10h}), calcolata con secondo quanto previsto dalle Norme ISO, pari a 20000 e 40000 ore di funzionamento.

Si ricorda che le durate dei cuscinetti sono calcolati su coefficienti di carico dinamico forniti dai costruttori dei cuscinetti.

Tali carichi sono basati sulla durata che si prevede che possa venir raggiunta o superata dal 90% dei cuscinetti di una campionatura sufficientemente grande, costituita da unità apparentemente tutte uguali.

Il 50% dei cuscinetti può raggiungere una durata cinque volte superiore a quella indicata dal calcolo.

Il 10% dei cuscinetti, tuttavia, può non raggiungere la durata di vita calcolata.

Permissible load on the bearings

The theoretical basic fatigue life for bearings is calculated according to the provisions of the ISO R 281-1 Standard.

Life is calculated assuming that motors are running under normal ambient conditions, without abnormal vibrations, without axial or radial loads beyond the ones mentioned in the following tables and with operating temperatures of the bearings ranging between -30 and +85 C°.

Life calculated this way is called basic life (L_{10h}) expressed in hours of operation.

50% of bearings reaches a life equal to five times the basic life resulting from the calculation.

The next tables show the maximum permitted axial and radial loads for a basic life (L_{10h}), calculated according to the provisions of the ISO Standards, equal to 20000 and 40000 hours of operation.

It should be noted that the bearing life is calculated on dynamic load coefficients supplied by the bearing manufacturers.

These loads are based on the life that is expected to be reached or exceeded by 90% of the bearings of a sufficiently large sampling, consisting of units apparently all the same.

50% of the bearings can reach a life five times longer than the one indicated by the calculation.

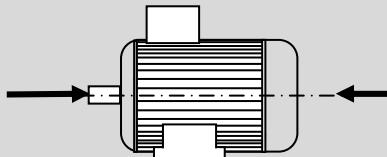

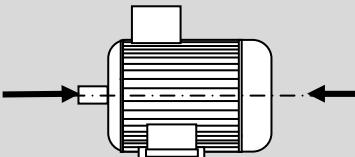

10% of the bearings, however, cannot reach the calculated life

Nel caso di alimentazione a 60 Hz i carichi devono essere ridotti del 10%

Per forme costruttive diverse o per carichi combinati (assiali e radiali) consultare ELECTRO ADDA Spa.

Please ask ELECTRO ADDA Spa for other mounting arrangements or simultaneous radial and axial forces

Carichi radiali ammessi

Forma IM-B3 IM-B35 (alimentazione 50 Hz)

I valori dei carichi radiali sono dati sia per carichi applicati all'estremità dell'albero (X_{max}) che in corrispondenza della battuta sul mozzo dell'albero (X_0).

I carichi radiali applicabili variano linearmente con il variare del punto di applicazione, pertanto per carichi posti ad una distanza X dalla battuta dell'albero (X_0), il carico massimo applicabile è dato dalla seguente espressione:

$$Fra_X = \frac{C_{x_0} - C_{x_{max}}}{X_{max}} \times X + C_{x_{max}}$$

Dove:

- Fra = carico radiale ammesso nel punto X
- C_{x_0} = carico radiale ammesso nel punto X_0
- $C_{x_{max}}$ = carico radiale ammesso nel punto X_{max}
- X_{max} = sporgenza d'albero
- X = distanza dal punto di applicazione del carico radiale alla battuta dell'albero

Per verificare che il tiro di cinghia non superi i valori massimi ammessi, si può utilizzare la seguente formula:

$$F = \frac{19100 \times P \times K}{n \times D}$$

In cui

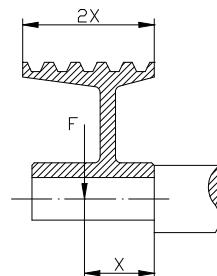

- F = Forza radiale in N
- P = Potenza trasmessa in kW
- n = Velocità in giri/min
- D = Diametro della puleggia in metri
- K = 2 per pulegge con tenditore
- K = 2.25 per pulegge con profilo a "V"
- K = $2.5 \div 3$ per cinghie piane senza tenditore, o per servizi pesanti con tutti i tipi di puleggia

Permissible radial loads

Mounting IM-B3 IM-B35 (50 Hz)

Values of the radial loads are given both for loads applied to the shaft extension (X_{max}) and in correspondence of the face on the shaft hub (X_0).

Radial loads that can be applied linearly, change with the change of the application point, therefore for loads placed at a distance X from the shaft face (X_0), the maximum load that can be applied is given by the following expression:

Where:

- Fra = permitted radial load at point X
- C_{x_0} = permitted radial load at point X_0
- $C_{x_{max}}$ = permitted radial load at point X_{max}
- X_{max} = shaft extension
- X = distance from the application point of the radial load to the shaft face

To verify that the belt pull does not exceed the maximum value allowed the following formula can be used:

In which

- F = Newton radial force
- P = Power transmitted in kW
- n = Number of revs. per minute
- D = Pulley diameter in metres
- K = 2 for flat pulley with tension roller
- K = 2.25 for sheaves with "V" belt
- K = $2.5 \div 3$ for flat belts without tension roller, or for heavy duty with any type of pulley

Nei diagrammi delle pagine seguenti sono indicati i massimi carichi radiali ammessi per una durata di base (L_{10h}) , calcolata con secondo quanto previsto dalle Norme ISO, pari a 20000. con alimentazione a 50 Hz. Nel caso di alimentazione a 60 Hz i carichi devono essere ridotti del 10%

Qualora fossero richiesti carichi o durate calcolate superiori a quelli indicati nei diagrammi si prega di interpellare Electro Adda Spa.

The next tables show the maximum permitted axial and radial loads for a basic life (L_{10h}) , calculated according to the provisions of the ISO Standards, equal to 20000.

Please ask Electro Adda Spa in case calculated loads or life higher than the ones mentioned in the tables are required.

Costruzione per carichi radiali elevati
Construction for high radial loads

Intervalli di lubrificazione

Nella tabella sono riportati gli intervalli di lubrificazione (espressi in ore) e le quantità di grasso per la lubrificazione dei cuscinetti.

Si consiglia di utilizzare il grasso SKF LGHP2 o corrispondenti.

Il grasso di lubrificazione, normalmente utilizzato per la lubrificazione dei cuscinetti è idoneo per il funzionamento a temperature comprese tra -30°C e +110°C.

Gli intervalli di lubrificazione sono riferiti ad una temperatura del cuscinetto di circa 80°C, nel caso di funzionamento a temperature inferiori tali intervalli possono essere aumentati.

Per i motori con asse verticale, gli intervalli di lubrificazione devono essere dimezzati

In the following table the lubrication intervals (expressed in hours) and the grease quantity to lubricate bearings are showed.

Recommended grease types are SKF LGHP2 or corresponding types.

Lubrication grease normally used to lubricate bearings, is suitable for operating temperatures between -30° and +110°C.

Lubrication intervals

Lubrication intervals are referred to a bearing temperature of approx. 80°C, in case of operation at lower temperatures, these intervals can be increased.

For motors with vertical axis, lubrication intervals must be halved.

Scatola morsetti e morsettiera

La morsettiera dei motori grandezza 63÷355 è normalmente a sei morsetti.

Nel caso di motori con collegamento a triangolo è pertanto possibile realizzare (se consentito dalle caratteristiche della macchina comandata) l'avviamento stella-triangolo.

Nella morsettiera dei motori grandezza 400÷500 sono normalmente previsti 3 soli morsetti (uno per ogni fase) ai quali vengono collegati i cavi di alimentazione.

In tal caso il collegamento degli avvolgimenti è realizzato all'interno della macchina stessa e non è accessibile.

A richiesta, anche i motori grandezza 400÷500 possono essere realizzate con 6 morsetti in modo da avere tutti i terminali degli avvolgimenti accessibili

La basetta portamorsetti è di materiale antimuffa non igroscopico.

La scatola morsettiera ha il grado di protezione IP 55 o IP 56, purché il collegamento dei cavi di alimentazione sia realizzato in modo adeguato.

Per la grandezza 63÷355 la scatola morsettiera è posta sulla parte superiore del motore e l'uscita cavi puo' essere realizzata su ogni lato della scatola (da precisare in sede d'ordine).

A richiesta, se è prevista l'uscita dei cavi verso il basso, è possibile fornire un opportuno condotto sagomato per facilitare l'ingresso dei cavi.

A richiesta, è anche possibile posizionare la scatola morsetti a destra o a sinistra del motore guardando dal lato albero.

Terminal box and block

The terminal block for motors frame size 63÷355 is normally provided with six terminals.

Therefore, in case of motors with delta connection, it is possible to perform the start-delta starting (if this is allowed by the features of the driven machine).

The terminal block for motors frame size 400÷500 is normally provided with 3 terminals only (one each phase), to which the supply cables are connected.

In this case the winding connection is made inside the machine and it is not accessible.

Upon request, motors frame size 400÷500 can be equipped with 6 terminals in order to have all winding terminals accessible.

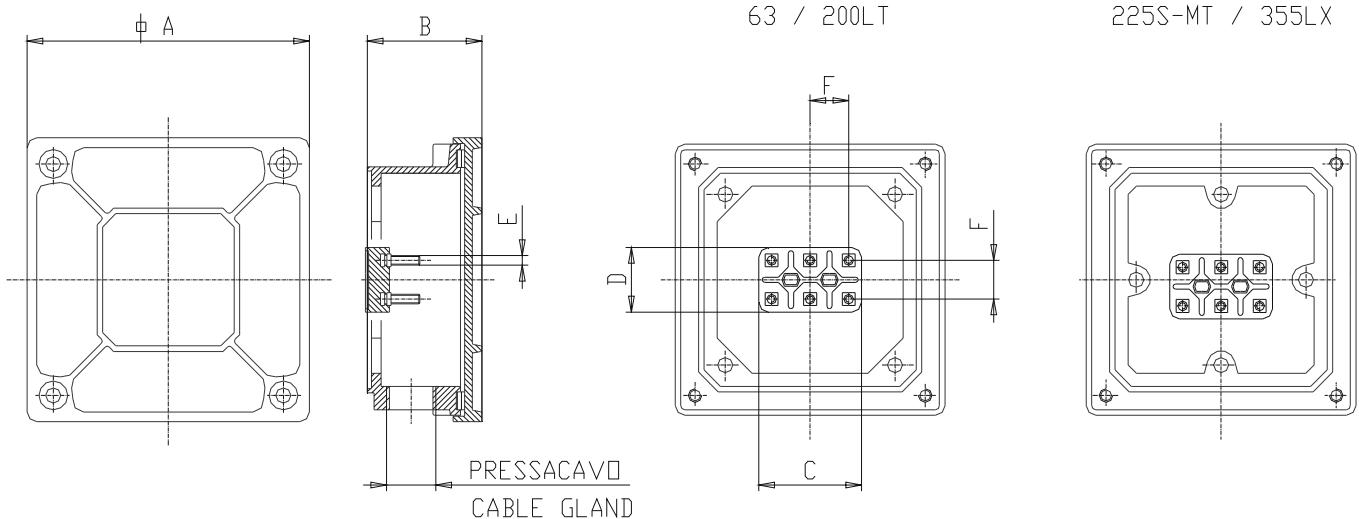

The terminal block is made with non-hygrosopic and anti-mold material.

Terminal box has IP 55 or IP56 protection degree, provided that the supply cable connections are properly made.

For motors frame size 63÷355 the terminal box is positioned on the top of the motors and the cable exit can be made in each side of the box (to be specified when placing the order).

Upon request, if the cable exit is provided downwards, it is possible to supply a proper shaped conduit to make the cable entry easy.

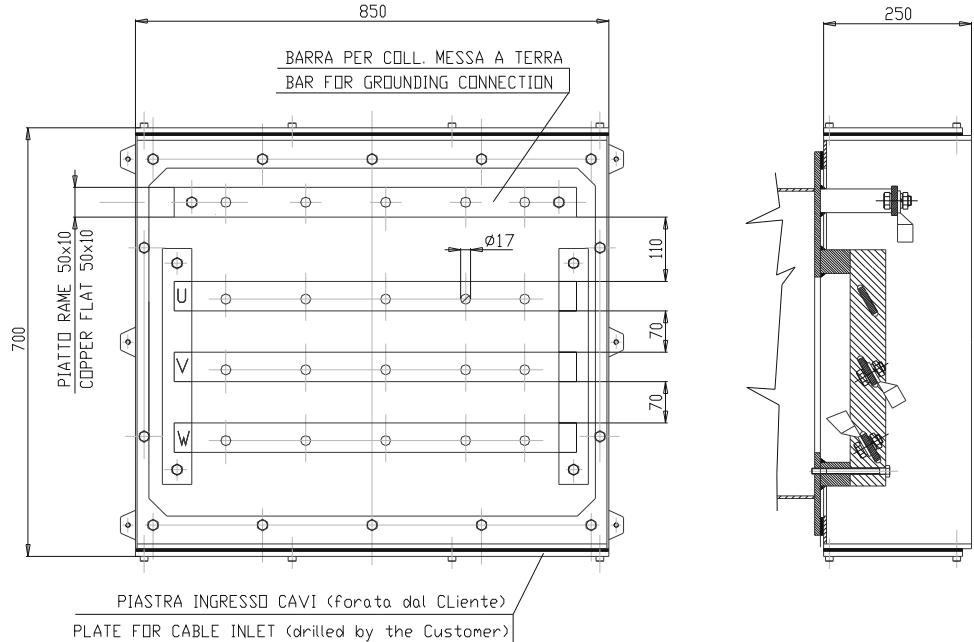

Upon request the terminal box can also be positioned on the right or on the left of the motor seen from the shaft.

I motori grandezza 400÷500 hanno la scatola coprimorsettiera in acciaio e possono avere 3 o 6 morsetti. Le scatole sono fornite con una piastra uscita cavi amovibile forata a cura del cliente.

motors size 400÷500 have steel terminal box and can have 3 or 6 terminals. The boxes are supplied with a removable cable outlet plate to be drilled by the customer.

Morsettiera a 3 morsetti
Terminal block with 3 terminals

Morsettiera a 6 morsetti fornita con N.3 piastre in rame per collegamento stella/triangolo
Terminal block with 6 terminals supplied with Nr.3 copper plates for star/delta connection

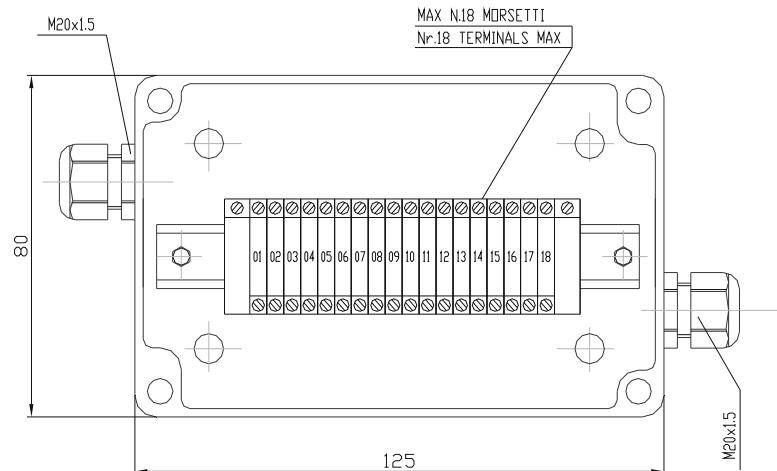

Scatola morsetti ausiliari

I motori sono predisposti per il montaggio di scatole morsetti ausiliari con grado di protezione IP55 o IP56.

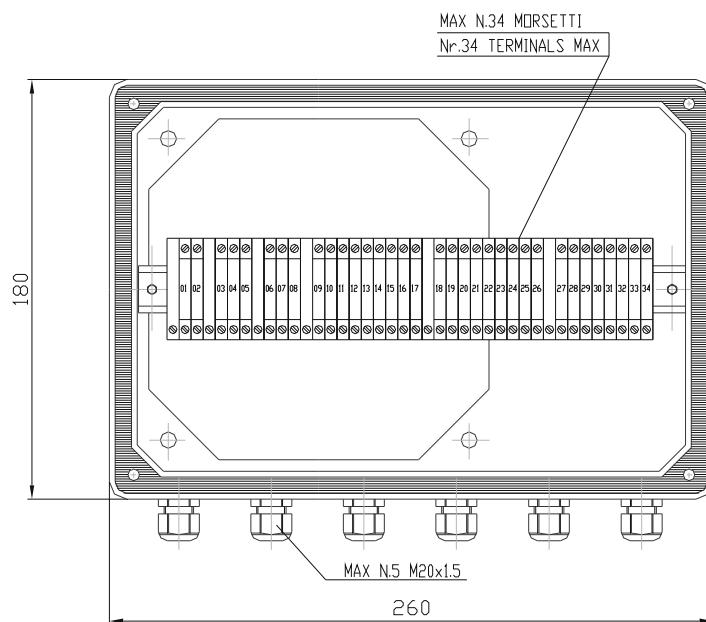

All'interno delle scatole morsetti trovano posto i collegamenti elettrici di eventuali accessori quali termoprotettori, termorivelatori, scaldiglie, encoder ecc...

Le scatole morsetti ausiliari sono di 3 tipi in funzione alla grandezza del motore e al numero di collegamenti elettrici richiesti dal Cliente e possono essere in alluminio (fino alla grandezza 355LX) oppure in acciaio (motori dal 400LX al 500LX).

Di seguito sono riportate le dimensioni d'ingombro.

Scatola morsetti ausiliari in alluminio per motori dal 225T al 315M
Aluminium auxiliary terminal box; motor sizes from 225T to 315M

Scatola morsetti ausiliari in alluminio per motori dal 355L al 355LX
Aluminium auxiliary terminal box; motor sizes from 355L to 355LX

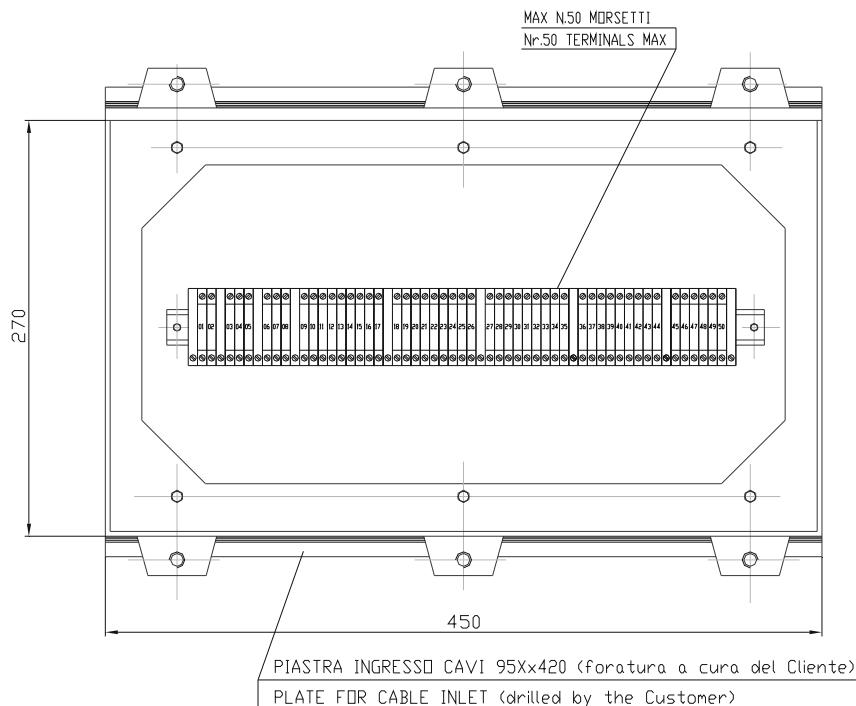

Auxiliary terminal box

Motors are prepared for mounting auxiliary terminal boxes with IP 55 or IP56 protection degree.

Inside the terminal boxes, the terminals for possible accessories such as thermal protections, thermal detectors, anticondensation heaters etc. can be placed.

There are 3 types of auxiliary terminal boxes according to motor size and the number of electrical connections required by the Customer. They can be made of aluminium (up to size 355LX) or steel (from 400LX to 500LX).

Hereunder are mentioned the overall dimensions.

Scatola morsetti ausiliari in acciaio per motori dal 400LX al 500LX
Auxiliary steel terminal box ; motor sizes from 400LX to 500LX

Gabbia di rotore

I motori di grandezza 63÷355 hanno normalmente il rotore realizzato in alluminio pressofuso.

I motori di grandezza 355Lx÷500 hanno le gabbie realizzate in rame/ottone saldato con processo T.I.G. o M.I.G. al fine di aumentare il rendimento delle macchine e ottimizzare le caratteristiche di avviamento.

Rotor cage

Motors with frame size 63÷355 have the rotor cage in die-cast aluminium.

Motors with frame size 355Lx÷500 have the rotor cage in copper/brass soldered using the T.I.G or M.I.G process in order to increase the electric machine efficiency and optimize starting characteristics.

Isolamento, avvolgimento

I motori serie M;AR sono realizzati in classe d'isolamento F.

Il conduttore in filo di rame elettrolitico ricotto è isolato con smalto speciale (doppio smalto), è classificato in classe di isolamento H.

Tutti i materiali isolanti utilizzati per la realizzazione dei motori sono corrispondenti alla classe d'isolamento F o H.

L'avvolgimento subisce un rigoroso trattamento consistente in un' impregnazione ad immersione con resine di classe F polimerizzanti a caldo.

A richiesta è possibile realizzare una tropicalizzazione comprendente a sua volta una spruzzatura di smalto antisalvo e copertura finale, a spruzzo, con elevate caratteristiche di resistenza al calore, all'umidità, agli agenti chimici e all'azione corrosiva dell'ambiente marino.

Insulation, winding

MAR line motors are made in insulation class .

The soft copper electrolytic wire is insulated by using a special enamel (double enamel). Such enamel is classified as H insulation class.

All insulating materials used to produce motors are in F or H insulation class.

The winding undergoes a severe treatment as follows: it is impregnated by soaking it in oven-curing F class resins.

Upon request it is possible to make a tropicalization following a process including a spraying of anti-salty enamel and, finally, it is coated using a spray with heat-proof, humidity-proof, chemical agent and sea-ambient corrosive action resistant characteristics.

Potenza e dati tecnici

Le potenze ed i dati indicati nelle Tabelle "Dati Tecnici" sono riferiti al servizio continuo (S1), alla temperatura ambiente di 50°C.

Le caratteristiche di funzionamento sono garantite con le tolleranze stabilite dalle norme CEI EN 60034-1 e le raccomandazioni IEC 60034-1, indicate nella tabella.

Caratteristiche	Tolleranza
Rendimento	Macchine di potenza $\leq 150 \text{ kW}$ -15% di $(1 - \eta)$ Macchine di potenza $> 150 \text{ kW}$ -10% di $(1 - \eta)$
Fattore di potenza	+1/6 ($1 - \cos\phi$) Minimo 0.02 Max 0.07
Corrente di spunto	+20% del valore garantito
Coppia di spunto	-15% + 25% del valore garantito
Coppia massima	-10% del valore garantito
Scorrimento	Macchine di potenza $< 1 \text{ kW}$ $\pm 30\%$ del valore garantito Macchine di potenza $\geq 1 \text{ kW}$ $\pm 20\%$ del valore garantito

Ratings and technical data

Power and data mentioned in the Technical Data Tables are for continuous duty (S1) at an ambient temperature of 50°C.

The operating characteristics are guaranteed with the tolerances defined by the CEI EN 60034-1 Standards and the IEC 60034-1 Recommendations, mentioned in table

Characteristics	Tolerances
Efficiency	Motor power $\leq 150 \text{ kW}$ -15% of $(1 - \eta)$ Motor power $> 150 \text{ kW}$ -10% of $(1 - \eta)$
Power factor	+1/6 ($1 - \cos\phi$) Min 0.02 Max 0.07
Locked rotor current	+20% of guaranteed value
Locked rotor torque	-15% + 25% of guaranteed value
Pull out torque	-10% of guaranteed value
Slip	Power motor $< 1 \text{ kW}$ $\pm 30\%$ of guaranteed value Power motor $\geq 1 \text{ kW}$ $\pm 20\%$ of guaranteed value

Tensione di alimentazione - Collegamento

I motori serie grandezza 63÷ 280 possono essere realizzati per alimentazione a tensioni nominali comprese tra 220 V e 690 V a 50 Hz e a 60 Hz; i motori gradezza 315 ÷400 possono essere realizzati per tensioni comprese tra 400 V e 690 V.

Normalmente sono previsti per essere utilizzati per alimentazione a 230/400 V e 400/690 V o 690 V a 50 Hz e 440V 60Hz

La tensione più bassa è realizzata con collegamento a triangolo mentre la tensione maggiore è ottenuta con collegamento a stella.

Ovviamente l'avviamento a stella-triangolo è possibile unicamente su una rete corrispondente alla tensione ottenibile con il collegamento a triangolo.

Oscillazioni di tensione e frequenza

I motori possono funzionare senza subire danni, se la tensione di alimentazione varia entro i limiti stabiliti dalle Norme di riferimento.

In particolare i motori possono funzionare con variazione di tensione del 10 % e di frequenza del 5% con una variazione combinata massima del 10% con sovratemperatura conformi a quanto previsto dalle norme di riferimento.

Supply voltage - Connection

Motors frame size 63÷280 can be manufactured for supply at rated voltages included between 220 V and 690 V at 50 Hz and at 60 Hz; motors frame size 315÷400 can be manufactured for voltages included between 400 V and 690 V.

They are normally designed to be used for supply at 230/400 V and 400/690 V or 690 V at 50 Hz and 440V 60Hz.

The lower voltage is made with delta connection while the higher voltage is obtained with star connection.

Obviously the star delta starting is only possible on a mains corresponding to the voltage that can be obtained with the delta connection.

Voltage and frequency variations

Motors can work without failures if the supply voltage variations are limited as stated in the reference Standards.

In particular, motors can run with voltage variations of 10 % and frequency variations of 5 % with a maximum combined variation of 10 % with temperature rise in compliance with the provisions of the reference Standards.

Squilibrio di tensione

Un sistema trifase risulta squilibrato quando le tre tensioni di alimentazione non sono uguali tra loro o non sono sfasate tra di loro di 120°.

Lo squilibrio può essere provocato dalla presenza sulla linea di carichi monofasi o da carichi squilibrati.

Il valore dello squilibrio può essere calcolato con la seguente formula;

$$\text{Squilibrio}(\%) = \left(\frac{V_{\max} - V_{\text{med}}}{V_{\text{med}}} * \frac{V_{\text{med}} - V_{\min}}{V_{\text{med}}} \right)$$

Dove

V_{\max} = tensione più alta

V_{\min} = tensione più bassa

V_{med} = media delle tre tensioni

Le conseguenze di uno squilibrio delle tensioni applicate ad un motore asincrono comporta una diminuzione delle coppie e ad un aumento delle perdite che si traducono in un surriscaldamento del motore.

La norma IEC60034-26 fornisce le prescrizioni per il declassamento del motore in funzione dello squilibrio delle tensioni di alimentazioni,

Unbalanced voltage

A three-phase system is unbalanced when the three supply voltages are not equal among them or are not unbalanced among them by 120 °.

The unbalance can be caused by the presence of single-phase loads or unbalanced loads on the line.

The unbalance value can be calculated using the following formula;

Were

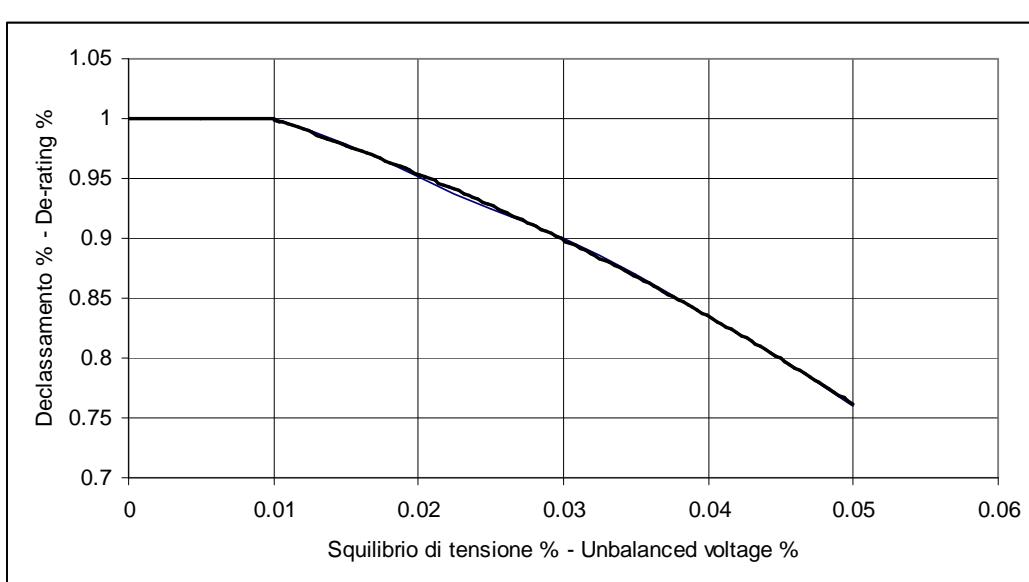

V_{\max} = maximum voltage

V_{\min} = minimum voltage

V_{med} = average voltage

The effects of an unbalance of the voltages applied to an asynchronous motor involve a decrease of the torques and an increase of the losses that result in an overheating of the motor.

The standard IEC60034-26 provides the requirements for the motor derating based on the supply unbalance.

Declassamenti

Deratings

Le tabelle dei dati tecnici sono riferiti alla temperatura ambiente max 50°C

Per condizioni ambientali diverse, le potenze variano e si ottengono applicando i fattori correttivi indicati nella tabella, mantenendo le sovrateperature previste per la classe d'isolamento.

The tables of technical data are referred to an ambient temperature of 50°C

In different environmental conditions output ratings vary, and are obtainable by applying the factors as mentioned in table, maintaining the temperature rise provided for by the insulation class.

Temperatura ambiente (°C) Ambient temperature (°C)					
30	40	45	50	55	60
1.12	1.06	1.03	1.00	0.96	0.93

Servizi

I dati tecnici riportati nelle tabelle sono riferiti al servizio continuo (S1). A richiesta possono essere forniti motori per Servizio limitato S2 (30 o 60 minuti) o per altri tipi di servizio

Duty

All technical data mentioned in the tables are referred to continuous duty (S1). Upon request, motors for limited Duty S2 (30 or 60 minutes) or for other duties can be supplied.

Sovraccarichi

I motori in servizio continuo possono sopportare i seguenti sovraccarichi

Overloads

Continuous duty motors can withstand the following overloads

Sovraccarico Overload %	Durata Duration Min.	Intervallo Interval Min.
10	10	15
20	6	15
30	4	15
40	3	15
50	2	15

In tali condizioni di funzionamento in sovraccarico, le sovrateperature possono risultare superiori di 10°C ai limiti previsti per la classe d'isolamento.

In such operation conditions with overload, temperature rises may be 10°C higher than the limits provided for by the insulation class.

Avviamenti

I motori sono idonei per i seguenti tipi di avviamento:

- Diretto
- Stella – triangolo
- Autotrasformatore
- Soft-start (1)
- con inverter (2)

1) Al termine dell'avviamento il soft-starter deve essere bypassato. In caso contrario è necessario utilizzare un motore con avvolgimento con isolamento rinforzato

2) E' necessario utilizzare un motore con avvolgimento con isolamento rinforzato (vedere paragrafo alimentazione da inverter).

Startings

Motors are suitable for the following types of starting

- Direct
- Star – delta
- By autotransformer
- Soft-start (1)
- by inverter (2)

1) At the end of the starting, the soft-starter must be bypassed. If not, it is necessary to use a motor with winding with reinforced insulation.

2) It is necessary to use a motor with winding with reinforced insulation (see paragraph inverter supply).

Rumorosità

Le tabelle dei dati tecnici riportano i valori di rumorosità (LpA) e in potenza (LwA) sonora misurati ad un metro di distanza espressi in dB(A).

I valori di rumorosità sono rilevati con motore funzionante a vuoto e con una tolleranza di 3 dB(A).

Noise

The technical features table contains the values of A-sound pressure level (LpA) and A sound power level (LwA), measured at a one meter distance. Sound levels are measured in no-load conditions and have tolerances of 3 dB(A),

Vibrazioni

I motori sono bilanciati dinamicamente con mezza chiavetta applicata all'estremità d'albero secondo la norma IEC 60034-14 e hanno grado di vibrazione B in esecuzione standard.

La seguente tabella indica i limiti raccomandati dell'intensità di vibrazione per le varie altezze d'asse.

Vibrazioni più elevate possono verificarsi sul motore installato sull'impianto, a causa di vari fattori come basamenti non adeguati o reazioni da parte del sistema azionato. In questi casi, verifiche più approfondite dovrebbero essere eseguite su ogni parte componente l'installazione.

Vibrations

Motors are dynamically balanced with a half key applied to the shaft extension in accordance with the IEC 60034-14 standard to vibration severity grade B in standard execution.

The following table shows the maximum vibration grades with respect to the different frame sizes.

Larger vibrations may occur on motors installed at site, due to various factors such as unsuitable foundations or reactions caused by the driven load. In such cases checks should also be carried out on each element of the installation.

Grado Equilibratura Vibration grade	Montaggio Mounting	Altezza d'asse - Frame size 56 ≤ H <132			Altezza d'asse - Frame size 132 < H ≤280			Altezza d'asse - Frame size >280

Protezioni termiche

A richiesta sui motori serie MAR è possibile installare le seguenti protezioni termiche:

Termistori PTC

Alla temperatura d'intervento questo dispositivo varia repentinamente la resistenza standard. Generalmente la protezione è realizzata con tre elementi sensibili, uno per fase, collegati in serie e con i due terminali in un'apposita morsettiera posta all'interno della scatola morsetti o in un'apposita scatola morsettiera ausiliaria.

Protettori bimetallici

Motoprotettori con contatto normalmente chiuso. Il contatto si apre quando la temperatura degli avvolgimenti raggiunge limiti pericolosi per il sistema isolante.

Termometri a resistenza di platino PT100

Il valore di resistenza varia linearmente con la temperatura degli avvolgimenti. Dispositivo particolarmente adatto per un rilievo continuo della temperatura.

Scaldiglie anticondensa

Per i motori funzionanti in ambienti ad elevata umidità e con forti escursioni termiche si consiglia l'applicazione di scaldiglie per eliminare la condensa. Sono di tipo a nastro e vengono montate sulla testata degli avvolgimenti di statore.

Viene normalmente prevista la loro alimentazione quando quella del motore viene interrotta, generando un riscaldamento che previene la formazione di condensa.

La tensione di alimentazione normale è 115 V o 220/240V.

I terminali delle scaldiglie sono portati ad un'apposita morsettiera posta all'interno della scatola morsetti principale. A richiesta possono essere portati ad una morsettiera posta in una scatola morsetti ausiliaria.

Le potenze normalmente impiegate sono indicate nella tabella seguente.

Thermal protections

Upon request, the following thermal protections can be installed on the MAR line motors:

Positive temperature coefficient thermistors PTC

At the active temperature this device quickly changes its standard resistance value.

The protection is normally made by 3 sensitive elements, one for every phase, series connected and with two terminals in a specially provided terminal board located in the main terminal box or in a specially provided auxiliary terminal box.

Bimetallic devices

Motoprotectors with contact normally closed. The contact opens when the winding temperature reaches limits dangerous to the insulation system of the motor.

Platinum resistance thermometers PT100

Variable linear resistance with the winding temperature. Device particularly suitable for a continuous winding temperature monitoring.

Anticondensation heaters

Motors subject to atmospheric condensation, either through standing idle in damp environments or because of wide ambient temperature variations, may be fitted with anticondensation heaters.

They are of tape form and are normally mounted on the stator winding head.

Anticondensation heaters are normally switched on automatically when the supply to the motor is interrupted, heating the motor to avoid water condensation.

Normal supply voltage is 115 V or 220/240V.

Anticondensation heater terminals are led to a specially provided terminal board located in the main terminal box. Upon request they can be led to a terminal board located in an auxiliary terminal box.

The power values normally used are shown in the following table.

Altezza d'asse Frame size	Potenza (W) Power (W)
132÷160	40
180÷200	45
225÷250	50
280÷315	100
355	200
400	300
450	400
500	400

Tappi scarico condensa

I motori grandezza 355L÷500 sono normalmente forniti di tappi posti sulla carcassa (forme B3 e derivate) o sugli scudi (forma V1) per poter scaricare la condensa che si può formare all'interno del motore.

Sui motori grandezza 63÷355LT i fori scarico condensa sono realizzabili a richiesta.

I motori sono forniti con i fori di scarico condensa chiusi e tali devono rimanere per garantire il grado di protezione (IP) richiesto.

In funzione delle condizioni operative di funzionamento è necessario che periodicamente tali tappi vengano aperti per permettere lo scarico della condensa.

Condensation drainage plugs

Motors frame size 355÷500 are normally provided with plugs placed on the frame (mountings B3 and derived mountings) or on the shields (mounting V1) in order to drain condensation that can form inside the motor.

Motors frame size 63÷355LT can be provided with condensation drainage holes upon request.

Motors are supplied with closed condensation drainage holes, they must remain closed to guarantee the required protection degree (IP). Based on the operating conditions it is necessary to periodically open the plugs to allow condensation drainage.

I valori di rendimento sono calcolati in accordo con IEC 60034-2-1;
2007

Efficiency values are given according to IEC 60034-2-1 ;2007

Alimentazione da inverter

Il motore asincrono trifase presenta ottime doti di affidabilità e rendimento. Alimentato tramite un convertitore di frequenza (inverter) è in grado di realizzare un ottimo sistema di azionamento a velocità variabile.

L'azionamento a velocità variabile consente di adeguare esattamente le caratteristiche del motore alle esigenze del carico consentendo anche di migliorare il rendimento complessivo dell'azionamento, contribuendo al risparmio energetico e ad una conseguente riduzione del costo di gestione dell'azionamento stesso.

L'azionamento a velocità variabile consente inoltre di rendere più graduale l'avviamento rispetto agli altri tipi di avviamento (piena tensione, stella-triangolo ecc) e quindi, oltre a sollecitare meno gli organi di accoppiamento e la macchina operatrice, consente di limitare le correnti sulla rete di alimentazione.

I motori asincroni trifasi serie MAR previsti per alimentazione da inverter sono progettati e costruiti operando delle scelte progettuali e costruttive che consentono un funzionamento ottimale ed affidabile. Occorre infatti considerare che, generalmente, l'inverter alimenta il motore asincrono con una corrente non sinusoidale con un certo contenuto armonico. Che dipende in particolare : dal tipo di inverter, dal valore della frequenza di commutazione e dalla lunghezza dei cavi di alimentazione.

Inoltre i fronti ripidi di tensione ai morsetti del motore (dv/dt) determinati dai ridotti tempi di commutazione degli IGBT, producono delle notevoli sollecitazioni sui materiali isolanti.

Particolare attenzione richiede pertanto il sistema d'isolamento del motore che deve essere in grado di sopportare tali maggiori sollecitazioni.

Nei motori di questa serie, espressamente previsti per alimentazione da inverter, vengono pertanto adottate le seguenti tecnologie costruttive:

- Impiego di lamierino magnetico al silicio a bassa cifra di perdita con isolamento inorganico per ridurre le perdite nel nucleo magnetico.
- Utilizzo per la realizzazione degli avvolgimenti di filo di rame smaltato a doppio isolamento speciale per inverter con classe termica 200°C.
- Isolamento tra le fasi, in cava e sulle testate in Nomex®.
- Trattamento di impregnazione sotto vuoto in autoclave con successiva essiccazione in forno per consentire un maggiore isolamento ed aumentare la resistenza alle sollecitazioni elettrodinamiche.
- Cuscinetto lato opposto accoppiamento isolato (per es. SKF INSOCOAT®), al fine di eliminare l'effetto delle correnti d'albero tipico delle alimentazioni ad alta frequenza di commutazione (di serie per i motori con altezza d'asse superiore a 355 mm e a richiesta per i motori grandezza 200÷315).
- I motori grandezza 355x÷500, previsti per alimentazione da inverter, hanno il rotore a gabbia

Inverter supply

The asynchronous three-phase motor offers excellent reliability and efficiency qualities. Supplied by means of a frequency converter (inverter) this kind of motor is able to realize an excellent variable speed driving system.

The variable speed drive allows to exactly adapt the motor features to the requirements of the load allowing also to improve the overall performances of the drive, contributing to the energy saving and to a consequent reduction of the operation cost of the drive itself.

Moreover the variable speed drive allows to make starting more gradual compared to other types of starting (full voltage, star-delta etc.), therefore, besides having a lower stress on the couplings and the manufacturing machine, it also allows to limit currents on the supply mains.

MAR line asynchronous three-phase motors to be used for inverter supply are designed and manufactured based on design and manufacturing choices that allow an optimum and reliable operation. It has to be considered that generally the inverter supplies the asynchronous motor with a non sinusoidal current having a certain harmonic contents. This is due in particular: to the type of inverter, to the value of the switch frequency and to the length of the supply cables.

Moreover steep voltage fronts to the motor terminals (dv/dt) originated by the short commutation times of the IGBT, generate considerable stresses on the insulating materials.

Consequently the motor insulation must be carried out with the utmost care because it has to be able to withstand such higher stresses.

Therefore, in the motors of this line, designed on purpose for inverter supply, the following construction technologies are used.

- Low-loss silicon lamination with inorganic insulation to reduce losses in the magnetic core.
- Windings made using copper electrolytic wire with double insulation, special for inverters, with thermal class 200°C.
- Nomex® insulation between phases, in the slots and on the winding ends.
- Impregnation treatment under vacuum in autoclave and subsequent oven drying to allow a higher resistance to electrodynamic stresses.
- Insulated non drive end bearing (ex. SKF INSOCOAT®), in order to eliminate the effect of the shaft currents, typical in supplies with high switch frequency (standard production for motors in frame size above 355 mm and upon request for motors frame size 200÷315).
- Motors frame size 355÷500 designed for inverter supply have a rotor with single welded copper

semplice saldata di rame per ottenere un migliore rendimento e caratteristiche ottimali nell'alimentazione da inverter. L'impiego della gabbia semplice riduce significativamente le correnti armiche ad alta frequenza presenti nelle gabbie rotore. L'impiego della gabbia semplice rende tali motori non idonei per avviamento da rete. A richiesta è possibile realizzare motori che possono essere alimentati sia da rete che da inverter.

- I motori possono essere forniti di encoder.

I motori previsti per alimentazione a 690 V sono realizzati con un sistema di isolamento rinforzato (HPI system).

I motori normali sono previsti con sistema di ventilazione IC411 (autoventilato) e sono idonei per applicazioni su macchine operatrici a coppia quadratica (pompe o ventilatori) e per funzionamento a coppia costante con frequenza di alimentazione minima di 30 Hz.

A richiesta possono essere forniti motori con sistema di ventilazione IC416 (servoventilato) per applicazioni a coppia costante con frequenza minima di 5 Hz.

I motori sono previsti per funzionare correttamente con un dV/dT massimo di 2000V/μsec.

Nel caso di valori più elevati è consigliabile l'impiego di un adeguato filtro tra motore ed inverter per ridurre le sollecitazioni sul motore.

Analogamente è necessario un filtro nel caso di eccessiva lunghezza dei cavi di alimentazione (distanza tra motore e inverter maggiore di 50 metri)

La velocità massima, che i motori possono raggiungere è limitata dalle sollecitazioni meccaniche che i motori possono sopportare senza danneggiamenti. Nella tabella dei dati tecnici nelle pagine seguenti è riportato tale limite per il funzionamento in servizio continuativo.

Per brevi periodi è possibile superare tale limite di circa il 10% senza che si verifichino danneggiamenti dei cuscinetti.

Nelle tabelle dei dati tecnici, sono riportate oltre alle caratteristiche elettriche, i limiti di velocità quale i motori possono funzionare erogando la potenza nominale con un margine tra la coppia massima e la coppia nominale del 50%.

Oltre tale velocità e fino alla velocità massima ammessa i motori possono funzionare a potenza ridotta. Il valore di coppia massima (espresso in Nm) del motore in queste condizioni si ottiene moltiplicando il valore della coppia massima per il rapporto tra velocità nominale e velocità massima al quadrato.

Occorre tener presente che aumentando la velocità di funzionamento aumenta anche il rumore emesso dal motore stesso, pertanto per aumenti superiori al 20% della velocità nominale si consiglia l'impiego di motori servoventilati (IC 416).

cage, in order to obtain a better efficiency and optimum characteristics in the inverter supply. The use of the single cage considerably reduces the high frequency harmonic currents, present in the rotor cages. Because of their single cage, these motors are not suitable for starting from the mains.) Upon request it is possible to make motors suitable to be supplied both from the mains and from an inverter.

- Motors can be equipped with encoder.

Motors designed for 690 V supply are manufactured with a reinforced insulation system (HPI system).

Standard motors are designed with IC411 cooling system (selfventilating) and are suitable for applications on manufacturing machines with quadratic torque (pumps or fans) and for operation with constant torque with minimum supply frequency of 30 Hz.

Upon request, motors with IC416 cooling system (with forced ventilation) for applications with constant torque with minimum frequency of 5 Hz, can be supplied.

Motors are designed to correctly run with a maximum dV/dT of 2000V/μsec.

In case of higher values it is advisable to use a proper filter between motor and inverter to reduce stresses on the motor.

Similarly a filter is necessary in case of too long supply cables (distance between motor and inverter higher than 50 metres).

The maximum speed that the motors can reach is limited by the mechanical stresses that the motors can withstand without being damaged. The technical data table on the following pages gives the value of this limit for the continuous duty operation.

It is possible to exceed this limit of approx. 10% for short periods without having damages at the bearings.

In addition to the electric features, the technical data table also contains the speed limits at which the motors can operate supplying the rated output with a 50% margin between the maximum torque and the rated torque.

Above this speed and up to the maximum speed permitted, the motors can run at reduced power. The value of the maximum torque of the motor (given in Nm) in these conditions is obtained multiplying the value of the maximum torque by the ratio between the rated speed and the maximum speed squared.

It has to be considered that with the increase of the operation speed, also the noise emitted by the motor itself, therefore for increases higher than 20% of the rated speed it is advisable to use motors with forced ventilation (IC 416).

I valori di rendimento sono calcolati in accordo con IEC 60034-2-1; 2007 con alimentazione sinusoidale

Efficiency values are given according to IEC 60034-2-1 ,2007 with sinusoidal supply

Dimensioni d'ingombro

Le dimensioni d'ingombro sono in accordo con le Norme IEC 60072.
L'uscita d'albero e le dimensioni delle flange di accoppiamento sono realizzate con le seguenti tolleranze:

Simbolo <i>Symbol</i>	Dimensione <i>Dimension</i>	Tolleranza <i>Tolerance</i>
D – DA	< 30	j6
	> 30 a 50	k6
	> 50	m6
N	< 250	j6
	> 250	h6
F - FA		h9

Le flange di accoppiamento e i fori delle pulegge per le cinghie devono avere il foro con tolleranza H7.

Nella tabella sono indicate le tolleranze ammesse per le diverse altezze d'asse.

Overall dimensions

*Overall dimensions are in accordance with the IEC 60072 Standards.
The shaft extensions and coupling flange dimensions are designed with the following fits:*

Coupling flanges and holes for belt pulleys should have an ISO fit of at least H7.

The deviations specified below are permitted for the dimensions shown in table

Simbolo <i>Symbol</i>	Dimensione <i>Dimension</i>	Scostamento Ammissibile <i>Permitted deviation</i>
H	< 250	-0,5
	> 280	-1

Motori con ventilazione assistita (IC416)

Tutti i motori serie C possono essere forniti con un sistema di ventilazione IC416.

In tal caso viene installato un opportuno ventilatore all'interno o all'esterno del copriventola.

La ventilazione risulta pertanto indipendente dalla velocità di rotazione del motore stesso.

Tale soluzione è particolarmente idonea per i motori alimentati da inverter.

Motors with assisted ventilation (IC416)

All C line motors can be supplied with cooling system IC 416 on request.

In this case a proper fan is fitted inside or outside the fan cover.

Consequently the ventilation is independent of the rotation speed of the motor itself.

This solution is particularly suitable for inverter supplied motors.

Nelle pagine successive sono riportate le dimensioni d'ingombro dei motori servoventilati con sistema di ventilazione IC416.

A richiesta del cliente i motori possono essere forniti con encoder; in tal caso la quota totale (L) non subirà variazioni.

In the next pages are mentioned the overall dimensions of the motors with independent ventilation with ventilation system IC416.

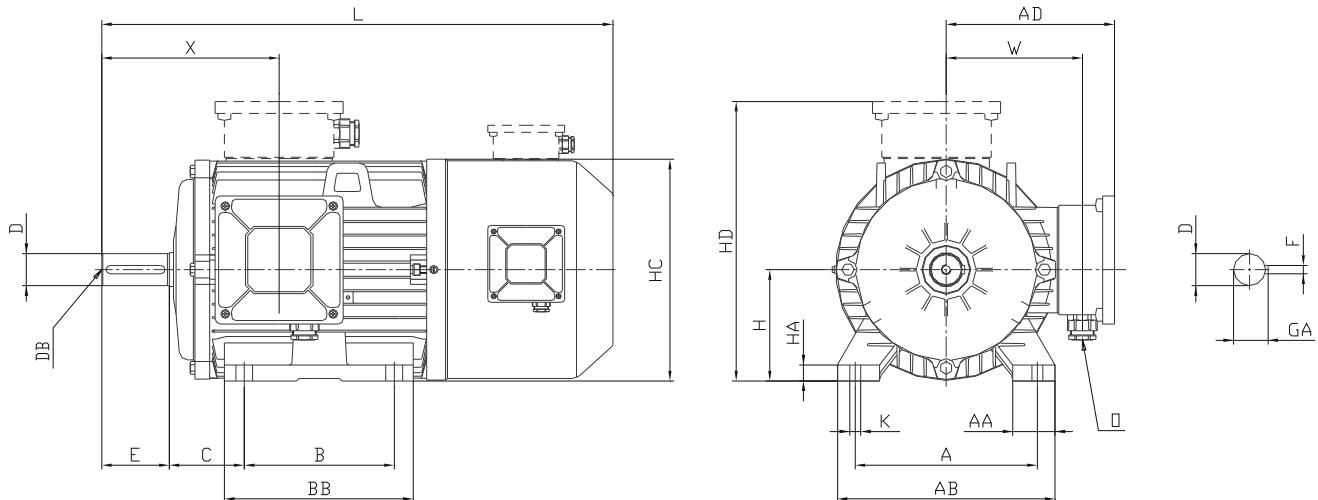

On request the motors can be supplied with the encoder. in which case the total length (L) will not increase.
